Ans. (c) Strong alkalis dissolve in aqueous solutions to	44. NaCl is a salt, which is formed by-
give OH <sup>-</sup> ions.	(a) Strong acid and weak base
like NaOH <sub>(S)</sub> $\xrightarrow{\text{H}_2\text{O}}$ Na <sup>+</sup> <sub>(aq)</sub> + OH <sup>-</sup> <sub>(aq)</sub>	(b) Weak acid and weak base
like NaOH <sub>(S)</sub> $\rightarrow$ Na (aq) +OH (aq) H <sub>2</sub> O	(c) Strong acid and strong base
$KOH_{(s)} \xrightarrow{H_2O} K^+_{(aq)} + OH^{(aq)}$	(d) By weak acid and strong base
Weak acids are not completely separated upon	<b>RRB ALP &amp; Tec. (30-08-18 Shift-I)</b>
dissolving with water. like-	Ans : (c) Sodium chloride (NaCl) is a common salt,
$NH_3 - NH_3 + H_2O \rightleftharpoons NH_4^+ + OH^-$	which is formed by the reaction of a strong acid or hydrochloric acid 'HCl' with the strong base 'sodium
	hydroxide' (NaOH).
(iii) Salt	$NaOH + HCl \longrightarrow NaCl + H_2O$
	The above reaction is a good example of a
40. What is the chemical formula of common salt?	neutralization reaction. Acids turn blue litmus into red
(a) $HCl$ (b) $NaCl$	and react with alkalis to form salts and water. The alkali
(c) KOH (d) NaOH	solution turns red litmus into blue.
RRB NTPC 28.01.2021 (Shift-I) Stage Ist	45. The food salt (NaCl) is made of?
Ans. (b) :	(a) A strong acid and a strong base
Chemical Name Chemical formula	(b) A weak acid and a weak base
Sodium Chloride (Common salt) NaCl	<ul><li>(c) A weak acid and a strong base</li><li>(d) A strong acid and a weak base</li></ul>
Sodium Hydroxide NaOH	(u) A strong actu and a weak base RRB ALP & Tec. (20-08-18 Shift-I)
Sodium thiosulphate (Hypo) $Na_2S_2O_3.5H_2O$	Ans : (a) See the explanation of above question.
41. In general, how can a neutralization reaction	46. What is the chemical name of common salt
be written?	eaten?
(a) Alkali + acid $\rightarrow$ water + gas	(a) sodium bicarbonate (b) sodium chloride
(b) Alkali + acid $\rightarrow$ salt + water	(c) sodium salicylate (d) sodium hydroxide
(c) Alkali + acid $\rightarrow$ salt + gas	RRB NTPC Stage I <sup>st</sup> 22.04.2016 (Shift-II)
-	Ans : (b) The chemical name of the eaten common salt
(d) Alkali + acid $\rightarrow$ salt + precipitate <b>PBP</b> Crown <b>D</b> 16 10 2018 (Shift I)	is sodium chloride (NaCl). Salt is produced by the
RRB Group-D 16-10-2018 (Shift-I)	evaporation process of seawater. Sodium chloride is an essential part of human food.
<b>Ans. (b)</b> In general, a neutralization reaction can be written as -	Sodium Bicarbonate: Eating soda.
	Sodium hydroxide: caustic soda.
$Alkali + Acid \rightarrow Salt + Water$	Sodium silicate: uses to make glass and card board etc.
42. Metals react with acids to produce.	47. Whose chemical formula is NaCl?
(a) salts and chlorine (b) salts and alkalis	(a) ammonia (b) water
(c) salts and hydrogen (d) salts and water	(c) common salt (d) sugar
<b>RRB ALP &amp; Tec. (09-08-18 Shift-II)</b>	RRB NTPC 02.04.2016 (Shift-I) Stage I <sup>st</sup>
Ans: (c) Metals react with acids to make related salts	<b>Ans : (c)</b> NaCl is the chemical formula of common salt. Salt (sodium chloride) is an essential part of human
and hydrogen gases.	food. The chemical formula of water $(H_2O)$ , ammonia
Like-	(NH <sub>3</sub> ) and sugar ( $C_{12}H_{22}O_{11}$ ).
$2Na + 2HCl \rightarrow 2NaCl + H_2$	48. Which of the following is used to melt ice?
43. Which of the following salts is acidic?	(a) salt (b) hydrogen
(a) sodium carbonate	(c) caustic soda (d) citric acid
(b) sodium acetate	RRB NTPC 18.04.2016 (Shift-II) Stage I <sup>st</sup>
(c) ammonium phosphate	Ans : (a) Salt (sodium chloride) is used to melt ice.
(d) magnesium sulphate	Freezing mixture is made by mixing sodium chloride
RRB ALP & Tec. (17-08-18 Shift-I)	(NaCl) with ice.
<b>Ans : (d)</b> When A weak alkali reacts with strong acid,	49. What happens as a result of a reaction between
the obtained salt will be acidic in nature. $M_{\alpha}(OII) + II SO \rightarrow M_{\alpha}SO + 2II O$	an acid and an alkali?
$Mg(OH)_2 + H_2SO_4 \rightarrow MgSO_4 + 2H_2O$	(a) salts and oxygen (b) acids
$ \begin{pmatrix} Weak \\ base \end{pmatrix} \begin{pmatrix} Strong \\ acid \end{pmatrix} \begin{pmatrix} Salt \\ acidic in nature \end{pmatrix} $	(c) Alkali (d) Salts and water <b>BBB Crown D 24</b> 10 2018 (Shift HI)
base (acid ) (acidic in nature)	<b>RRB Group-D 24-10-2018 (Shift-III)</b> Ans. (d) Salt and water are produced as a result of the
	reaction between acid and alkali and this reaction is
$M_{\alpha}SO = \frac{2H_2O}{2} M_{\alpha}OH + USO$	called neutralization reaction. Generally, the
$MgSO_4 \xrightarrow{2H_2O} Mg(OH)_2 + H_2SO_4$ (Weak acid) (Strong base)	neutralization reaction can be written as follows.
("our usia") (brong base)	

$Alkali + Acid \rightarrow Salt + Water$	(iv) pH Value
For example-	
NaOH + HCl $\rightarrow$ NaCl + H <sub>2</sub> O (Allegi) (A gid) (Salt) (write)	54. If a solution changes the colour of blue litmus
(Alkali) (Acid) (Salt) (water)	nanon to nod what will the nU of this solution
50. When an acid reacts with a metal oxide,	be?
andas a product?	(a) 14 (b) more than 7
(a) salt, water (b) acid, water	(c) 7 (d) less than 7
(c) alkali, water (d) alkali, acid	RRB NTPC 03.02.2021 (Shift-II) Stage Ist
<b>RRB Group-D 25-09-2018 (Shift-III)</b>	Ans. (d) : If a solution turns the blue litmus into red
Ans. (a) : When an acid is reacted with a metal. Oxide,	then it shows the acidic nature hence its pH value is less
salt and water are obtained as a product. For example,	than 7. If a solution turns the red litmus in to blue then it
salt (NaCl) and water ( $H_2O$ ) are formed when sodium	shows the basis nature means it's pH value more than 7.
oxide (Na <sub>2</sub> O) is reacted with hydrochloric acid (HCl).	55. A solution turns red litmus blue, the pH is
$Na_2O + 2HCl \rightarrow 2 NaCl + H_2O$	likely to be-
51. Sodium hydroxide reacts with to form	(a) 4 (b) 10
a simple salt solution?	(c) 5 (d) 1
(a) sodium chloride solution	RRB JE CBT-II 29–08–2019 (evening)
(b) oxygen gas	Ans. (b) Red litmus paper turns blue under basic or
(c) hydrochloric acid	alkaline conditions. So if a solution turns Red litmus
(d) Carbon dioxide gas	into blue then it is a basic solution. As the pHs, less than
RRB Group-D 17-09-2018 (Shift-III)	7 are acidic while pHs greater than 7 are alkaline.
Ans. (c) Sodium hydroxide (NaOH) reacts with	Hence the pH of the solution will be 10.
hydrochloric acid (HCl) to form a simple salt (NaCl)	56. Hydrogen ion concentration of which of the
solution.	following solution is Highest?
$NaOH + HCl \rightarrow NaCl + H_2O$	(a) $pH = 8$ (b) $pH = 5$
52. Which of the following is an example of a salt	(c) $pH = 10$ (d) $pH = 4$
whose pH value of aqueous solution is less than	KKD IVIEC 05.04.2021 (SIIII-II) Stage Ist
7?	<b>Ans. (d) :</b> The solution with the pH value of (pH=4) has
(a) sodium chloride (b) sodium carbonate	highest Hydrogen ion concentration because this
(c) sodium bicarbonate (d) ammonium chloride	solution is much acidic than other given option.
<b>RRB</b> Group-D 17-09-2018 (Shift-I)	57. If the pH value of river water is, then its
RRB Group-D 17-09-2018 (Shift-II)	(a) exactly 7 (b) zero
Ans (d) pH is the measure of the concentration of	(c) above 7 (d) below 7
hydrogen ion in a solution. The less hydrogen ions the	RRB NTPC 31.01.2021 (Shift-I) Stage Ist
solution has, the higher the pH value. The pH scale has	Ans. (d) : The pH value is a measure of the acidity and
a value between 0 and 14, with a pH value of 7 solution	basicity of a solution. It is defined as the negative-
neutral, less than 7 solutions acidic and more than 7	logarithm of the liquefied hydrogen ions $(H^+)$
solutions alkaline. Ammonium chloride has a pH value	concentration. If the pH value of river water is less than
lower than 7. Therefore Aqueous solution of ammonium	7 then it is considered to be polluted with acidic waste.
chloride is acidic.	If the pH is more than 7 then the solution is considered
53. Which of the following statements regarding	to be alkaline in nature.
salts are correct?	58. What is the pH value of lemon Juice
(a) Salts have pH value of 1.	approximately?
(b) Salts are a combination of acid and alkali and	(a) 9 (b) 2
react intensely with metals.	(c) 12 (d) 7
(c) The most common form of salt (common salt)	
is a combination of sodium hydroxide and	Ans. (b) : Lemon Juice nature is acidic with a pH of
sulphuric acid.	about 2, but once metabolized it actually becomes
(d) Salts are formed by the combination of acid	alkaline with a pH value above 7. pH is a measure of hydrogen ion concentration, a measure of the acidity or
and alkali by neutralization reaction.	alkalinity of a solution.
RRB Group-D 04-12-2018 (Shift-III)	59. When the pH value increases from 7 to 14, it

If the pH of a salt is zero, it is a salt of  $pH = -log [H^+]$ (a) Strong acid and weak base or  $pH = log \frac{1}{\left\lceil H^+ \right\rceil}$ (b) weak acid and strong base (c) Strong acid and strong base (d) Weak acid and weak base pH values range from 0 to 14, solutions that have a pH **RRB Group-D 12-10-2018 (Shift-I)** value less than 7 are acidic, solutions that have a pH Ans. (a) If a salt has a pH value between 0-3.5, it is a value greater than 7 are alkaline, neutral solutions have a pH of 7. The pH value is used in alcohol, sugar, paper strong acid and is a weak base. While the pH of a salt is more than 10.5, it is a strong alkali and is a weak acid. etc. industries. PH value of some common substances 76. The pH value of solution A is 6, the pH value of Lemon-2.2 - 2.4solution B is 8, and the pH value of solution C Vinegar- 2.4 - 3.4 is 2. Which solution will have the highest Alcohol- 2.8 - 3.8 concentration of hydrogen ion? Beer-4.0 - 5.0(a) C Human urine-4.8 - 8.4(b) A Human saliva- 6.5 - 7.5 (c) None of them have hydrogen ions Human blood- 7.3 - 7.5 (d) B Milk-6.4 **RRB Group-D 22-09-2018 (Shift-I)** 72. The salts of strong acids and strong bases have Ans. (a) We know that,  $pH = -log(H^+)$ a pH value. where  $(H^{+})$  is the concentration of hydrogen ion of solution (a) 0 (b) 7 (c) more than 7 (d) less than 7  $pH \propto \frac{l}{H^+}$ **RRB Group-D 01-11-2018 (Shift-II)** Ans. (b) Salts are usually formed by the neutralization Hence the solution (c) will have the highest reaction between acids and bases, so their pH value is 7. concentration of hydrogen ion.

77. The pH value of neutral solution is?	<b>Ans.</b> (a) If a solt has a pH value of 12, it is weak as $d$
(a) $0$ (b) $7$	<b>Ans. (c)</b> If a salt has a pH value of 12, it is weak acid and strong base.
$\begin{array}{cccccccccccccccccccccccccccccccccccc$	
RRB Group-D 12-11-2018 (Shift-II)	83. The pH of cannot be detected by direct use of pH paper
Ans. (b) Acidity increases when the pH value is less	(a) ink
than 7, and alkalinity increases when it is greater than 7.	
The pH value of neutral solution is 7.0. When the pH	(b) water
value of a solution is less than 7, that solution is acidic	(c) juice
and when the pH value is greater than 7, that solution is	(d) solid sodium bicarbonate
alkaline. The pH value of human body works between	RRB Group-D 27-09-2018 (Shift-III)
7.0 to 7.8	Ans : (d) The pH scale is used to express the basicity
78. The pH scale measures the hydrogen ion	or acidicity of a solution. The pH value represents the
concentration in a solution. What does P mean	concentration of hydrogen ion in an aqueous solution.
in this?	The pH of solid sodium bicarbonate in the above
(a) Power	question cannot be expressed by direct use of pH paper,
(b) Potenz, which means power in German.	as it is in solid state; While ions dissociate only in
(c) Potential, which means comfort in German.	aqueous solutions.
(d) Potency, which means power in German.	84. If the pH value of a salt is 14, then that salt is
RRB Group-D 10-12-2018 (Shift-I)	?
Ans. (b) pH is a measure of the acidity or basicity of a	(a) weak acid and weak base
solution. In this, $p = potenz$ which means power in	(b) weak acid and strong base
german. full form of pH is potential of hydrogen. Find it	(c) Strong acid and weak base
S.C Sarenson.	(d) Strong acid and strong base
79. The pH of a solution depends on the	RRB Group-D 12-10-2018 (Shift-III)
concentration of	R.R.B. JE. Stage - II 01-09-2019 (Shift - III)
(a) hydride ion (b) hydroxyl ion	Ans : (b) If the pH value of a salt is 14, then that salt is
(c) oxide ion (d) hydronium ion	a weak acid and a strong base. The pH value of a
RRB JE 26.06.2019 (Shift-IV)	substance is determined the acidic and alkaline
<b>Ans.</b> (d) The pH of a solution depends on the	properties by a scale of 0-14. If the pH value of a
concentration of its hydronium ion.	substance is less than 7 it is acidic and alkalinl in nature
80. Which one of the following matches is not correct?	when it is greater than 7 and neutral when it is 7.
(a) pH of blood – 7.4	<b>85.</b> What is the pH value of an alkaline solution? (a) more than 7 (b) less than 7
(b) pH of pure water $-7.5$	(a) more than 7 (b) less than 7 (c) 7 (d) 3
(c) pH of vinegar $-2.2$	RRB JE 26.06.2019 (Shift-IV)
(d) pH of milk $- 6.6$	Ans. (a) See the explanation of the above question.
RRB Group-D 10-12-2018 (Shift-III)	
Ans. (b) : Pure water is neutral. Its pH value is 7.	86. In universal indicators, what does a pH value of 4 to 5 indicate?
81. Which of the following solutions will have the	(a) weak acid (b) weak base
lowest pH value?	(c) strong acid (d) strong alkali
(a) Lemon juice (b) Pure water	RRB JE 22.05.2019 (Shift-II)
(c) blood (d) detergent	Ans. (a) In universal indicators, a pH value of 4 to 5
RRB Group-D 22-10-2018 (Shift-III)	indicates weak acid.
<b>Ans : (a)</b> The pH value is a measure of the acidity or	
basicity of a solution. Substances that have a pH value less than 7 are acidic, and those with a pH value greater	(v) Acid-Base Indicator
than 7 are alkaline. The pH value (2.2) of lemon juice is	(v) Acid-Base Indicator
minimum.	
pH value of pure water = $7.0$	87. Litmus solution is derived from
pH value of blood = $7.4$	(a) Hydrangea (b) Cabbage leaves
pH value of vinegar $= 3$	(c) Lichen (d) Petunia
pH value of milk = $6.4$	RRB NTPC 08.01.2021 (Shift-II) Stage Ist
82. If the pH value of a salt is 12, then it is a salt of	Ans. (c) : Litmus is used as an indicator to distinguish
	between acid and base. Litmus solution is obtained from
(a) Weak acid and weak base	lichen. It is a water soluble mixture of different dyes.
(b) Strong acid and weak base	Light blue litmus paper turns red under acidic solution
(c) weak acid and strong base	and red litmus paper turns into blue under basic or
(d) strong acid and strong base	alkaline solution. It is measured in pH range, the neutral
RRB Group-D 11-10-2018 (Shift-III)	litmus paper is purple.

(c) Francium element has the lowest ionization energy. Because only one electron is available in its last shell. Its chemical symbol is Fr and atomic number 89. The electronic configuration is 2,8,18,32,18,8,1.</li> <li>240. Which of the following properties increases with an increase in atomic number in the first and seventh groups of the modern periodic table? <ul> <li>(a) stirring with water</li> <li>(b) atomic size</li> <li>(c) Oxidation property</li> <li>(d) Highest connective state</li> </ul> </li>

<ul> <li>Ans. (b) In Both the first and the seventh groups of the periodic table there is increase in the size of their atoms with an increase in the atomic number, while the atoms of the elements decrease with the increase in the atomic number in a period.</li> <li>241. The element that has the highest electron affinity in the third period is that is. <ul> <li>(a) Si</li> <li>(b) Cl</li> <li>(c) Mg</li> <li>(d) Na</li> </ul> </li> <li>RRB Group-D 16-11-2018 (Shift-II)</li> </ul>	<ul> <li>245. The atomic numbers of the four basic elements of a period are 11, 13, 16 and 17. In the modern periodic table, atomic number of the most metallic element of these will be</li></ul>
<ul> <li>affinity in the third period is chlorine (Cl). Its atomic number is 17. It is placed in group-17 in the periodic table.</li> <li>242. The group that shows the correct order of the first ionisation potential is: <ul> <li>(a) Ge &gt; Si &gt; C</li> <li>(b) K &gt; Na &gt; Li</li> </ul> </li> </ul>	the third period. Thus, sodium (11Na <sup>23</sup> ) metal has the highest metallurgical properties. <b>246.</b> Which of the following options has the highest melting point and boiling point? (a) Lithium (b) Phosphorus
(c) $B > C > N$ (d) $B = Mg > Ca$ <b>RRB Group-D 30-10-2018 (Shift-II)</b> <b>Ans : (d)</b> The value of the ionization potential of atoms of elements increases when moving from left to right in	<ul> <li>(c) carbon</li> <li>(d) argon</li> <li>RRB Group-D 20-09-2018 (Shift-II)</li> <li>Ans. (c) Carbon is an element of groups IV – A of the p– block in the periodic table whose atomic number is</li> <li>6. Its melting point and boiling point are 355°C and</li> </ul>
<ul> <li>a period of the periodic table. While the ionization potential of atoms of elements decreases from top to bottom in a group of the periodic table, because these elements are elements of the same group IIA.</li> <li>243. From the given options, fill in the blanks using</li> </ul>	<ul> <li>4827°C respectively. Hence in the given options carbon has the highest melting point and boiling point.</li> <li>247. With the increase in atomic number in period <ul> <li>(a) Metallic character increases</li> </ul> </li> </ul>
<ul> <li>the correct option for the following statement.</li> <li> The element has the greatest tendency to lose electrons.</li> <li>(a) F (b) S</li> <li>(c) Fe (d) H</li> </ul>	<ul> <li>(b) Chemical reactivity decreases</li> <li>(c) Metallic character decreases</li> <li>(d) Chemical reactivity increases</li> <li><b>RPF JE (Electrical) 19.09.2019 (Shift - III)</b></li> </ul>
<b>RRB Group-D 30-10-2018 (Shift-I)</b> <b>Ans : (c)</b> Fe is a metallic element, while H, S, and F are non-metallic elements. Hence Fe is the element has the greatest tendency to lose electrons.	<ul> <li>Ans. (c) : With the increase in atomic number in a period of the periodic table metallic character decreases. Metallic character decreases as we move across the periodic table from left to right.</li> <li>248. Which of the following elements has maximum</li> </ul>
<ul> <li>244. How does the metallic property of an element change in the modern periodic table?</li> <li>(a) The metallic property increases from left to right in the period and from top to bottom in the group.</li> <li>(b) The metallic property increases in the period from left to right but decreases from top to bottom in the group.</li> <li>(c) Metallic property decreases from left to right</li> </ul>	atomic radius?         (a) S       (b) Cl         (c) P       (d) Na         RRB JE CBT-II 31.08.2019 IInd Shift         Ans : (d) The measure of the size of the atoms of any element is called the atomic radius. In the Modern periodic table, the atomic radius increases while moving from right to left periodic table. Among the given
<ul> <li>in a period and from top to bottom in a group.</li> <li>(d) The metallic property decreases in the period from left to right but increases from top to bottom in the group.</li> <li>RRB Group-D 29-10-2018 (Shift-III)</li> <li>Ans : (d) In a period, when moving from left to right, the metallic properties of the elements decrease and the</li> </ul>	options, sodium (Na) has highest atomic radius (227pm)         while atomic radius of S, P & Cl are 100, 195 175pm         respectively.         249. Glucose molecule breaks down into         (a) Cytoplasm       (b) Pyruvic acid         (c) Lactic acid       (d) Mitochondria         RRB NTPC 08.01.2021 (Shift-I) Stage Ist
non-metallic properties of the elements decrease and the bottom in any group of the periodic table, then there is an increase in metallic properties and decrease in non- metallic properties.	Ans. (b) : Glycolysis is the anaerobic breakdown of the glucose molecule in the cytoplasm of the cell. In glycolysis, one molecule of glucose $(C_6H_{12}O_6)$ forms two molecules of Pyruvic Acid (CH <sub>3</sub> COCOOH).

	6. Which of the following gases is obtained when
<b>11.</b> Non Metals & Non-Metallic	metals react with dilute acids?
Compounds and their	(a) Nitrogen (b) Hydrogen
Applications	(c) Oxygen (d) Carbon dioxide
Applications	RRB JE CBT-II 28–08–2019 (morning)
() Hydrogon	Ans. (b) : Metal react with dilute acids to form metallic
(i) Hydrogen	salts and hydrogen gas. For example, Aluminium foil
1 What kind of a resource is water?	reacts with dilute hydrochloric acid to produce
1. What kind of a resource is water?	aluminium chloride and hydrogen gas. The balanced

All these elements are chemically inert, because they neither release the electron nor accept. All these elements are found in zero group 18 (group zero or group VIII A) of the periodic table. Therefore, chlorine is not an inert gas.</li> <li>103. Which of the following is not a noble gas? <ul> <li>(a) Xenon</li> <li>(b) Chlorine</li> <li>(c) Neon</li> <li>(d) Argon</li> </ul> </li> <li>RRB Group-D 01-10-2018 (Shift-III)</li> <li>Ans. (b) See the explanation of above question.</li> <li>104. Which of the following is the electronic configuration of inert gas in chloride ion CI<sup>-</sup>?</li>	<ul> <li>(a) Si (b) Su</li> <li>(c) Se (c) Sulphur is S'.</li> <li><b>108.</b> Which of the following elements is polyatomic molecules? <ul> <li>(a) Argon (b) Sodium</li> <li>(c) Sulphur (c) Sodium</li> <li>(c) Sulphur (c) Sodium (c) Sulphur (c) Soluphur (c) Solu</li></ul></li></ul>

Ans : (d) The sulphur atom is multi-atomic, Sulphur is a light yellow, tasteless and odorless solid substance. It is mainly found in three forms.(1) rhombus (crystal)(2) Alpha sulphur(3) Beta sulphurSulphur is insoluble in water, but is highly soluble in a fluid called carbon disulphide. Sulphur is found in both combined and free forms. Sulphur is also used in some other industries such as pesticides, matchsticks, gunpowder, explosives etc.111. Which one of the following is a non-metallic mineral ? (a) Silver(b) Sulphur (c) Platinum	<ul> <li>115. Due to the presence of we get that smell, which tells us that the LPG cylinder is leaking? <ul> <li>(a) nitrogen peroxide</li> <li>(b) carbon monoxide</li> <li>(c) Sulphur compound</li> <li>(d) Carbon dioxide RRB NTPC 30.03.2016 (Shift-I) Stage I<sup>st</sup></li> </ul> </li> <li>Ans : (c) Due to the presence of the sulphur compound we feel that smell. Which tells us that the LPG cylinder is leaking. LPG mainly consists of propane and butane gas.</li> <li>116. What is the atomicity of sulphur? <ul> <li>(a) Polyatomic</li> <li>(b) Diatomic</li> <li>(c) Monoatomic</li> <li>(d) Triatomic</li> <li>RRB Group-D 26-10-2018 (Shift-II)</li> <li>RRB Group-D 25-10-2018 (Shift-II)</li> </ul> </li> </ul>
<b>RRB NTPC 15.02.2021 (Shift-II) Stage Ist</b> <b>Ans. (b) :</b> On the basis of composition, minerals are classified mainly as metallic and non-metallic minerals. Metallic minerals contain metal in raw form. Metals are hard substances that conduct heat and electricity and oftenly have a characteristic lustre or shine. Iron ore, bauxite, manganese ore are some examples. Metallic minerals may be ferrous or non-ferrous. A non-ferrous	Ans. (a) Sulphur is polyatomic, because sulphur is always found in its molecular form $S_8$ .
mineral does not contain iron but may contain some other metal such as gold, silver, copper or lead. Non- metallic minerals do not contain metals. Limestone, mica, sulphur and gypsum are examples of such minerals. The mineral fuels like coal and petroleum are also non-metallic minerals.	<ul> <li>(viii) Carbon</li> <li>117. Diamonds can be synthesized by subjecting pure carbon to : <ul> <li>(a) Very high pressure and low temperature</li> </ul> </li> </ul>
<ul> <li>112. What is the process to give strength to rubber by adding sulphur and heating to provide strength, maximum elasticity and durability?         <ul> <li>(a) Hydration</li> <li>(b) Inspiration</li> <li>(c) vulcanization</li> <li>(d) combustion</li> <li>RRB NTPC 18.04.2016 (Shift-III) Stage I<sup>st</sup></li> </ul> </li> <li>Ans : (c) Vulcanization- It is a chemical process in which 'rubber' is converted in a more durable condition by mixing 'sulphur'. By this process the Strength</li> </ul>	<ul> <li>(a) Very high pressure and high temperature</li> <li>(b) Very low pressure and high temperature</li> <li>(c) Very high pressure and low temperature</li> <li>(d) Very low pressure and low temperature</li> <li><b>RRB NTPC 30.01.2021 (Shift-II) Stage Ist</b></li> <li><b>Ans. (c) :</b> Diamonds can be synthesized by subjecting pure carbon to very high pressure and high temperature. These synthetic diamonds are small but are otherwise indistinguishable from natural diamonds.</li> </ul>
provided to the rubber. The process of vulcanization is used to make tires, shoe sources, hose pipes, hockey and other items. <b>113. 'Sulphur' is derived from which language?</b> (a) Latin (b) Sanskrit (c) Greek (d) Mandarin	118. The number of free electrons in the outer shell of a diamond's carbon atom is         (a) zero       (b) two         (c) four       (d) three         RRB ALP & Tec. (13-08-18 Shift-I)         Ans. (a) The number of free electrons in the outer
(d) Ivinitianing         RRB NTPC 04.04.2016 (Shift-II) Stage I <sup>st</sup> Ans : (a) Sulphur (16S <sup>32</sup> ) is a chemical non-metal element. Its name is derived from the Latin language. This is the element of the p-block placed in the 3rd period and 16th group of the periodic table.         114. What is the eye irritating compound when cutting onions?         (a) carbon       (b) nitrogen         (c) sulphur       (d) hydrogen	shell of a diamond's carbon atom is zero. Diamond is a allotrope of carbon and a transparent material. It is chemically the purest form of carbon. All carbon atoms in a diamond are connected by very powerful co-valent bond, so it is very rigid. Diamond is the most rigid substance in nature, all four electrons present in it are bounded by co-valent bond and not a single electron is free. Therefore diamond is the non-conductor of electricity and heat.
<b>RRB NTPC Stage I</b> <sup>st</sup> <b>28.04.2016 (Shift-I)</b> <b>Ans : (c)</b> The compound that irritates the eye when cutting onions is sulphur. Sulphur is abundant in nature in both free and combined states. The percentage of sulphur on the crust is 0.05%. Sulphur is also found in onions, garlic, eggs, mustard oil etc. Sulphur is obtained by the Fosch method and the Sicilian method.	<ul> <li>119. In writing Pencilis used         <ul> <li>(a) solid ink</li> <li>(b) lead</li> <li>(c) lead sulphate</li> <li>(d) graphite</li> <li>RRB J.E. 2014 (14.12.2014 Set-2, Red Paper)</li> </ul> </li> <li>Ans. (d) : Graphite is used in writing pencils. Graphite diamond, buckminster fullerence (C<sub>60</sub>) are allotropes of carbon.</li> </ul>

Which of the following is not an allotrope of carbon?</b> (a) graphite (d) fullerene	Ans. (b) Lead pencil is actually made of graphite so there is zero percentage of lead in it.         140. In

(b) carbon nano tube for removing permanent hardness of water or softening (c) diamond (d) graphite hardwater. It is highly soluble in water and forms RRB Group-D 15-11-2018 (Shift-II) strongly alkaline water solution. Ans. (a) Fullerene is also a crystalline allotrope of 5. Permanent hardness of water can be removed carbon. Its one molecule contains 60 or more carbon by adding atoms. Its molecules have a structure like a geodesic (a) Potassium Permanganate globe or football. It is the more reactive of all carbon (b) Washing Soda allotropes. (c) Bleaching Powder (d) Chlorine 12. Metals/ Metallic Compounds RRB NTPC 08.04.2021 (Shift-II) Stage Ist Ans. (b) : See the explanation of above question. and Their Applications Which of the following is used as an ingredient 6. of antacid? Sodium (a) ordinary salt (b) Calcium sulphate Sodium is a reactive metal, which if kept open 1. (c) sodium hydrogen carbonate reacts with \_\_\_\_\_\_ explode and catch fire. (d) sodium carbonate (b) Hydrogen (a) Oxygen **RRB Group-D 02-11-2018 (Shift-I)** (c) Nitrogen (d) Phosphorus Ans. (c) Sodium bicarbonate (NaHCO<sub>3</sub>) is also called RRB NTPC 27.02.2021 (Shift-I) Stage Ist baking soda. It is used as an ingredient of antacid, in Ans. (a) : Sodium is ordinarily quite reactive with air, making medicines for skin diseases and as a fire and the reactivity is a function of the relative humidity, extinguisher. or water vapour content of the air. The corrosion of Is baking soda chemically different from solid sodium by oxygen also is accelerated by the baking powder? presence of small amounts of impurities in the sodium. (a) Yes, baking soda is sodium bicarbonate, while baking powder is a mixture of sodium Sodium is the metal reacts vigorously with oxygen and then exploded and cateches fire. bicarbonate and tartaric acid. (b) Yes, baking soda is sodium bicarbonate,  $2Na_{(s)} + \frac{1}{2}O_{2(g)} \rightarrow Na_2 O_{(s)}$ while baking powder is calcium carbonate. To neutralize the effect of formic acid injected 2. (c) Yes, baking soda is sodium carbonate while by ant bite, which among the following can be baking powder is sodium bicarbonate. used? (d) No. they are chemically similar. (a) Calcium Carbonate (b) Potassium Carbonate RRB ALP & Tec. (29-08-18 Shift-III) (c) Sodium Carbonate (d) Sodium Bicarbonate Ans : (a) Baking soda is also known as sodium RRB NTPC 01.04.2021 (Shift-I) Stage Ist bicarbonate. Sodium bicarbonate is an inorganic Ans. (d) : The effect of sting of an ant can be compound. It is also called sweet soda or eatable soda. neutralized by rubbing with moist sodium bicarbonate The moleculer formula of baking soda is 'NaHCO3'. (baking soda). Since baking soda is alkaline in nature And its IUPAC name is sodium hydrogen carbonate. when it is rubbed on skin the formic acid reacts with Sodium bicarbonate is used to make baking powder. baking soda forming salt and water which is a Baking powder is mainly a mixture of sodium neutralization reaction. bicarbonate and tartaric acid. Sodium bicarbonate is Name the elements found in baking Powder. 3. used as an antacid in medicines to relieve stomach (a) Sulphur, Hydrogen, Carbon and Oxygen acidity. It is used as an antacid in medicines to remove (b) Potassium, Sulphur and Oxygen alkaline acidity. Being alkaline, sodium bicarbonate (c) Sodium, Hydrogen, Carbon and Oxygen neutralizes the excess acid present in the stomach and (d) Hydrogen, Potassium, Sulphur and Oxygen provides relief from indigestion. RRB NTPC 12.03.2021 (Shift-I) Stage Ist 8. Which of the following metals cannot be Ans. (c) : Baking Powder is sodium bicarbonates. obtained by reducing property of carbon? which is NaHCO<sub>3</sub>. The element present in it are sodium, (a) copper (b) sodium hydrogen carbon and oxygen. (c) iron (d) zinc Name the sodium compound which is used to 4 RRB ALP & Tec. (20-08-18 Shift-II) permanently remove the hardness of water. Ans: (b) Copper, Iron and Zinc metals are not found (a) Sodium hydroxide in free state. They are found in their ores in the form of (b) Sodium chloride copper pyrite, hematite and zinc sulphide respectively (c) Sodium hydrogen carbonate which are extracted by carbon reduction method. (d) Sodium carbonate Sodium is very reactive metal in nature. When it is left RRB Group-D 31-10-2018 (Shift-III) open in the air, it catches fire and hence it is kept in

Ans. (d) : Washing Soda or Sodium carbonate is used

142. Which allotropes of carbon form geodesic globes?

(a) fluorine

RRB NTPC 04.04.2016 (Shift-III) Stage Ist

RRB NTPC 19.01.2021 (Shift-II) Stage Ist

kerosene oil.

<ul> <li>9. The chemical name for "caustic soda" is:</li> <li>(a) sodium chloride</li> <li>(b) sodium hydroxide</li> <li>(c) sodium carbonate</li> <li>(d) sodium peroxide</li> </ul>	17. Which of the following metals gives yellow colour to flame when ignited?
RRB J.E. 2014 (14.12.2014 Set-2, Red Paper)	(a) sodium (b) potassium
Ans. (b) : The chemical name for "caustic soda" is	(c) calcium (d) barium
sodium hydroxide.	RRB SSE 21.12.2014
Chemical Name Common Name	Ans : (a) Sodium is a chemical element. It is the
NaCl (sodium chloride) - Simple Salt	second element of the first main group of the periodic
Na <sub>2</sub> CO <sub>3</sub> (sodium carbonate) - Washing soda	table. Metals exist in this group. Sodium metal atoms
10. What is the common name for sodium	are easily reduced to sodium ions by losing one
carbonate?	electron. Due to its reactivity, it is kept in vacuum or
(a) Eating Soda (b) washing soda	kerosene oil., it reacts With water with explosions and
(c) bleaching powder (d) ordinary salt	liberates hydrogen.
<b>RRB JE 28.06.2019 (Shift-IV)</b>	In air, it burns with yellow brightness to form a mixture
Ans. (b) See the explanation of above question.	of sodium oxide (Na <sub>2</sub> O) and sodium peroxide (Na <sub>2</sub> O <sub>2</sub> ).
11. Name the metal that can be easily cut with a	Potassium imparts violet colour upon burning.
knife:	18. The chemical formula of sodium carbonate is:
(a) sodium (b) copper (c) gold (d) aluminium	(a) $Na_3CO_2$ (b) $Na_2CO$
RRB ALP & Tec. (09-08-18 Shift-I)	(c) $NaCO_3$ (d) $Na_2CO_3$
Ans : (a) Sodium is an alkali metal that can be easily	RRB Group-D 10-12-2018 (Shift-I)
cut with a knife. The symbol for sodium is 'Na'. Sodium	RRB ALP & Tec. (30-08-18 Shift-I)
is a shiny metal. Due to oxidation in the air, a layer	Ans : (d) Sodium carbonate is also called washing
soon settles on it. It is a soft metal and a good conductor	soda. Its aqueous solution is alkaline, it is a common
of electricity. The impure ammonia dissolves sodium in	inorganic salt. The molecular formula of sodium
its liquid to give a blue solution. It combines with	carbonate is $Na_2CO_3.10H_2O$ and the full name is
mercury to form a solid alloy.	sodium carbonate decahydrate.
12. Which of the following metals can be cut with a	
knife?	19. When electricity is passed through an aqueous (saline) solution of sodium chloride, it
(a) aluminium (b) platinum	decomposes into which of the following:
(c) copper (d) sodium RRB Group-D 30-10-2018 (Shift-II)	(a) NaOH + $H_2$ + $Cl_2$ (b) NaOH + $H_2$ + $O_2$
Ans: (d) See the explanation of above question.	(a) NaOH + $H_2$ + $C_2$ (b) NaOH + $H_2$ + $O_2$ (c) NaOH + $HCl$ + $H_2$ (d) NaOH + $H_2$ + $N_2$
<ul><li>13. The metal that can be cut with a knife -</li></ul>	
	RRB ALP & Tec. (20-08-18 Shift-III)
(a) copper (b) aluminium (c) iron (d) sodium	Ans: (a) When current flows in an aqueous solution
RRB ALP & Tec. (10-08-18 Shift-I)	of NaCl, NaOH (sodium hydroxide) is formed, together
	with hydrogen at the cathode and chlorine gas at the anode.
Ans : (d) See the explanation of above question.	
14. Give an example of a metal which can be easily cut with a knife.	$2NaCl + H_2O \rightarrow 2 NaOH + H_2 + Cl_2$
	20. Which product is formed when electricity is
(a) Mercury (b) Sodium (c) Silver (d) Iron	passed through a solution made in water of
RRB-JE 30.08.2019, Ist Shift	sodium chloride?
	(a) sodium and water (b) sodium oxide
Ans. (b) : See the explanation of above question.	(c) sodium and chlorine (d) sodium hydroxide
15. Which of the following metals is stored in	RRB ALP & Tec. (20-08-18 Shift-II)
kerosene oil? (a) platinum (b) copper	Ans : (d) Sodium hydroxide is formed when electricity
	is passed through a solution made in water of sodium
(c) sodium (d) gold	chloride. It is also known as the chlor-alkali process.
RRB ALP & Tec. (09-08-18 Shift-II)	$2NaCl + H_2O \xrightarrow{\text{electricity}} 2NaOH + H_2 + Cl_2$
<b>Ans : (c)</b> Sodium is a very reactive metal, which reacts with oxygen present in the air and forms sodium oxide	21. What will be the gas produced in the reaction
and water to produce sodium hydroxide and hydrogen.	of sodium carbonate with hydrochloric acid?
It also catches fire during this reaction. Hence, it is	(a) hydrogen (b) chlorine
stored by dipping it in kerosene oil.	(c) Hydrogen chloride (d) Carbon dioxide
16. Sodium is stored in	RRB ALP & Tec. (13-08-18 Shift-I)
(a) Kerosene (b) Cold water	Ans : (d) The chemical name of the washing soda is
(c) hot water (d) water	sodium carbonate ( $Na_2CO_3$ ).
RRB Group-D 22-10-2018 (Shift-I)	The following products are formed when sodium
Ans : (a) See the explanation of above question.	
Ans. (a) see the explanation of above question.	carbonate is reacted with hydrochloric acid.

	<b>Ans : (c)</b> Sodium carbonate is known as washing soda.
$Na_2CO_3 + 2HCl \longrightarrow 2NaCl + H_2O + CO_2 \uparrow$	It is generally a salt, whose aqueous solution is alkaline.
Salt Water Carbon dioxide gas	Hence it is used for washing clothes. Hence it is also
That is, the reaction of sodium carbonate with	called Washing Soda. It is also used in removing
hydrochloric acid produces carbon dioxide gas.	hardness of water.
22. Gas produced with the reaction of the soda	28 is not one of the ingredients of
with hydrochloric acid.	toothpaste.
(a) hydrogen (b) oxygen	(a) fluoride
(c) Carbon dioxide (d) Carbon monoxide	(b) sodium carbonate
RRB Group-D 22-09-2018 (Shift-III)	(c) calcium carbonate
Ans. (c) See the explanation of above question.	(d) magnesium carbonate
23. Which of the following gases is released when	RRB NTPC Stage I <sup>st</sup> 22.04.2016 (Shift-I)
sodium hydrogen carbonate is heated?	Ans : (b) Sodium carbonate is not among the ingredients
(a) hydrogen (b) carbon monoxide	of toothpaste. Sodium carbonate (Na <sub>2</sub> CO <sub>3</sub> .10H <sub>2</sub> O) is
(c) carbon dioxide (d) oxygen	called washing soda. It is used to remove water hardness
RRB ALP & Tec. (14-08-18 Shift-III)	to purify
Ans : (c) Sodium hydrogen carbonate is also known as	29. Chemical name of caustic soda is
sodium bicarbonate. It is also called eating soda.	(a) sodium thiosulphate (b) sodium carbonate
-	(c) sodium chloride (d) sodium hydroxide
$2\text{NaHCO}_3 \xrightarrow{\text{Heat}} \text{Na}_2\text{CO}_3 + \text{CO}_2 + \text{H}_2\text{O}$	RRB NTPC Stage I <sup>st</sup> 26.04.2016 (Shift-I)
Sodiumhydrogen Sodiumcarbonate Carbon dioxide Water carbonate	Ans : (d) The chemical name for caustic soda is sodium
	hydroxide (NaOH). It is used in purifying petroleum,
24. Natrium is the Latin name of which of the	making soap, brightening in cotton clothes,
following: (a) Lithium (b) Sodium	manufacturing artificial silk etc.
(c) Rubidium (d) Potassium	Sodium Carbonate - washing Soda
RRB Group-D 15-11-2018 (Shift-II)	Sodium Chloride - Common Salt
Ans. (b) The symbols of the elements are made from	Sodium thiosulphate - used in photography.
one or two letters of their english names in Latin,	<b>30.</b> What is baking soda?
German or Greek languages. The sodium symbol is Na,	(a) Potassium permanganate
derived from its Latin name Natrium. Similarly K	<ul><li>(b) Sodium chloride</li><li>(c) sodium bicarbonate</li></ul>
(Kalium) of potassium and Fe (ferrous) symbol of iron.	(d) sodium carbonate
25. Which one of the following elements is never	RRB NTPC 29.03.2016 (Shift-II) Stage I <sup>st</sup>
found in nature as a free element?	Ans: (c) The chemical formula of baking soda is
(a) gold (b) platinum	"NaHCO <sub>3</sub> " which is also known as sodium bicarbonate.
(c) silver (d) sodium	It is used in food preparation and medicine etc
RRB Group-D 15-11-2018 (Shift-II)	31. Which of the following metals is stored in
Ans. (d) Sodium (Na) is an alkali metal. It is a highly	kerosene?
reactive white and soft metal, which is not found in	
nature as a free element. It is mainly found in the form	(b) Gold (Au) and Silver (Ag)
of sodium chloride (NaCl), sodium carbonate (Na <sub>2</sub> CO <sub>3</sub> )	(c) Potassium (K) and Sodium (Na)
and sodium nitrate (NaNO <sub>3</sub> ) etc. This metal is so soft	(d) Silicon (Si) and Mercury (Hg)
that it can also be cut with a knife.	RRB Group-D 04-12-2018 (Shift-II)
26. The sodium metal is kept inside the to	Ans. (c) Both sodium and potassium are stored in
prevent exposure to oxygen.	kerosene because they are both very active elements
(a) water (b) oil	that react very quickly with air and water.
(c) kerosene (d) liquid hydrogen	<b>32.</b> metal reacts intensely with cold water.

(c) zinc(d) magnesiumRRB Group-D 03-12-2018 (Shift-III)Ans. (a) Sodium makes more positively charged ions because an electron is found in the outermost shell of the sodium element, which easily escapes the outermost45.Na2O is a (a) alkalineAns. (a) Sodium makes more positively charged ions because an electron is found in the outermost shell of the sodium element, which easily escapes the outermost45.Na2O is a (a) alkaline (c) acidicAns. (a) Sodium oxide (Na2O) is an alkaline oxide. It is		
RRB Group-D 03-12-2018 (Shift-III)Ans. (a) Sodium makes more positively charged ions because an electron is found in the outermost shell of the sodium element, which easily escapes the outermost(a) alkaline (c) acidic (c) acidic (d) amphoteric RRB Group-D 01-11-2018 (Shift-II)Ans. (a) Sodium oxide (Na2O) is an alkaline oxide. It is		
Ans. (a) Sodium makes more positively charged ions       (c) acidic       (d) amphoteric         because an electron is found in the outermost shell of the sodium element, which easily escapes the outermost       (c) acidic       (d) amphoteric         Ans. (a) Sodium oxide (Na <sub>2</sub> O) is an alkaline oxide. It is		
because an electron is found in the outermost shell of the sodium element, which easily escapes the outermost <b>RRB Group-D 01-11-2018 (Shift-II)</b> <b>Ans. (a)</b> Sodium oxide (Na <sub>2</sub> O) is an alkaline oxide. It is	· · · · · · · · · · · · · · · · · · ·	
the sodium element, which easily escapes the outermost Ans. (a) Sodium oxide (Na <sub>2</sub> O) is an alkaline oxide. It is		
shen converting sourum into a positivery charged ion.		
	shen converting sourum into a positivery charged loli.	

46. The milkman adds a little bit of baking soda to	Ans. (a) Baking soda or sodium bicarbonate (NaHCO <sub>3</sub> )
the fresh milk:	is an inorganic compound. It is also called 'Sweet Soda'
<ul><li>(a) To prevent acidification of milk</li><li>(b) To improve the taste of milk</li></ul>	or Eating Soda, its IUPAC name is 'Sodium Hydrogen
<ul><li>(b) To improve the taste of milk</li><li>(c) To increase cream in milk</li></ul>	Carbonate'. Its solution is used to treat bee stings, so
(d) To improve the consistency of milk	that blisters do not occur. Different acids are found in
RRB Group-D 18-09-2018 (Shift-II)	the following substances such as lactic acid in milk,
Ans. (a) Baking soda/sodium bicarbonate (NaHCO <sub>3</sub> ) is	acetic acid in vinegar, citric acid in lemon juice and
an inorganic compound. It is also called sweet soda or	formic acid in bees stings.
eating soda, as it is used in making various dishes. Its	52. The element with atomic numberwill form
IUPAC name is sodium hydrogen carbonate. Baking	alkaline oxide.
soda has the following uses - It is used in giving reliefing	(a) 17 (b) 14
insects bite. Fresh milk is prevented from acidification	(c) 11 (d) 7
by adding some baking soda to it.	RRB Group-D 22-10-2018 (Shift-III)
47. Baking powder is a mixture of and	Ans. (c) An element with atomic number 11 i.e. sodium
	(Na) will form alkaline oxide. Sodium is an alkali
(a) sodium hydrogen carbonate, malic acid	metal. It is a highly reactive white and soft metal. Its
(b) sodium hydrogen carbonate, sulphuric acid	corrosion occurs in moist air, which causes a layer of
(c) sodium hydrogen carbonate, tartaric acid	sodium oxide (Na <sub>2</sub> O) to form.
(d) sodium carbonate, tartaric acid RRB Group-D 17-09-2018 (Shift-III)	53. Which of the following metals reacts vigorously
Ans. (c) Sodium bicarbonate or baking soda whose	with cold water?
common formula is NaHCO <sub>3</sub> . Baking powder is a	(a) iron (b) sodium
mixture of sodium hydrogen carbonate and tartaric acid.	(c) zinc (d) aluminium
It is used for quick cooking of food and to remove	<b>RRB Group-D 24-09-2018 (Shift-III)</b>
excessive acidity of stomach.	Ans. (b) Sodium metal reacts vigorously with cold
48. Which of the following is the use of sodium	water.
carbonate, which is an alkali?	
(A) Producing sodium compounds such as borax.	(ii) Calcium
(B) To remove permanent hardness of water.	54. Which of the following soil types is rich in soil
(C) Use in glass, soap and paper industries.	34. Which of the following som types is fich in som
	5 <b>···</b>

Its chemical / molecular formula is $FeCl_2$ . White	(a) acidic (b) amphoteric (c) neutral (d) alkaline
precipitate of ferrous hydroxide is obtained by adding alkali to the ferrous chloride compound.	(c) neutral (d) alkaline RRB Group-D 29-10-2018 (Shift-III)
	Ans: (d) Magnesium oxide (MgO) is a metal oxide,
(viii) Magnesium	whose solution is alkaline in nature. It is an inorganic
(viii) Magnesium	compound and turns red litmus paper into blue.
161. The symbol used for Magnesium is :	167. Magnesium ribbon burns with a shiny
(a) Mo (b) Ma	flame -
(c) Mn (d) Mg	(a) white (b) green
RRB NTPC 11.01.12021 (Shift-II) Stage Ist	
Ans. (d) : The symbol used for Magnesium is Mg. Mo	RRB Group-D 12-10-2018 (Shift-III)
is a symbol of the Molybdenum element and Mn stands	Ans : (a) Magnesium ribbon burns with a bright white
for Manganese. Magnesium is a shiny, silver or gray	flame. It burns in air to form MgO (magnesium oxide).
coloured metal that is light in weight and strong. The	168. White ash is produced by burning magnesium
density of magnesium is 1738 g/ml. Magnesium is	ribbon, which mixes in water to make
required for energy production, oxidative	(a) Magnesium halides
phosphorylation and glycolysis.	(b) Magnesium oxide
162. Which compound is produced when	(c) Magnesium hydroxide
magnesium ribbon is burn in air?	(d) Magnesium sulphate
(a) magnesium nitrate	RRB ALP & Tec. (21-08-18 Shift-III)
(b) magnesium carbonate	Ans: (c) Burning magnesium ribbons produces white
(c) magnesium oxide	
(d) magnesium nitride	ash, which is dissolved in water to form magnesium hydroxide. $MgO + H_2O \longrightarrow Mg(OH)_2$

(ix) Lead	Ans. (a) : Mercury (Hg), also called quicksilver, is a chemical element, liquid metal of Group 12 of the
	periodic table. The chemical symbol Hg derives from
169. What is the Chemical symbol of Lead?	the Latin hydrargyrum, "liquid silver." Mercury is the
(a) Pb (b) Mn	only elemental metal that is liquid at room temperature.
$\begin{array}{c} (a)  Fe \\ (b)  Fe \\ (c)  Fe \\ (c)  Zn \\ (c)  Fe \\ (c) $	It alloys with copper, tin, and zinc to form amalgams, or
RRB NTPC 27.01.2021 (Shift-II) Stage Ist	liquid alloys. An amalgam with silver is used as a filling
	in dentistry. Mercury does not wet the glass. Its rapid and uniform volume expansion throughout its liquid
Ans. (a) : The chemical symbol of lead is Pb.	range, made it useful in thermometers.
Pb (Latin name -plumbum)	174. Which of the following elements is a liquid at
Chemical name -Lead	room temperature?
Lead is still widely used for car batteries, pigments,	(a) Chromium (b) Mercury
ammunition, cable sheathing, lead crystal glass,	(c) Sodium (d) Titanium
radiation protection and in some solders.	RRB JE 27.05.2019 (Shift-IV)
170. What are the products as a result of thermal	RRB Group-D 19-09-2018 (Shift-I)
decomposition of lead nitrate?	RRB ALP & Tec. (17-08-18 Shift-III)
(a) lead oxide + oxygen + nitrogen dioxide	RRB NTPC 21.01.2021 (Shift-II) Stage Ist
(b) lead oxide + nitrogen dioxide	Ans. (b) : Mercury element is a liquid at room
(c) lead oxide + nitrogen dioxide + nitrogen	temperature. Mercury is the only metallic element that
trioxide	is liquid at standard conditions for temperature and pressure. The only liquid elements at standard
(d) lead oxide + nitrogen trioxide	pressure. The only liquid elements at standard temperature and pressure are Bromine (Br) and Mercury
<b>RRB</b> Group-D 11-12-2018 (Shift-II)	(Hg). Mercury is a chemical element with the symbol
Ans. (a) Thermal decomposition of lead nitrate is an	Hg and atomic number 80. It is commonly known as
example of thermal dissociation reaction, brown smoke	quicksilver and was formerly named hydrargyrum.
is emitted in it is nitrogen dioxide (NO <sub>2</sub> ). This reaction is as follows-	Mercury is used primarily for the manufacture of
	industrial chemicals or for electrical and electronic
$2Pb(NO_3)_2(s) \xrightarrow{\text{Heat}} 2PbO(s) + 4NO_2(g) + O_2(g)$	applications. It is used in some liquid-in-glass
lead nitrate (Lead oxide) (Nitrogen dioxide) (Oxygen)	thermometers, especially those used to measure high
171. When lead metal reacts with a copper chloride	temperatures. A still increasing amount is used as gaseous mercury in fluorescent lamps.Minamata
solution,	disease, sometimes referred to as Chisso-Minamata
(a) lead copper is formed	disease, is a neurological disease caused by severe
(b) There is no reaction.	mercury poisoning.
(c) Water is produced.	175 is an important metal required to make
(d) Lead chloride is produced.	amalgam.
RRB Group-D 15-11-2018 (Shift-II)	(a) aluminium (b) mercury

performance fibre; and Nomex, a high-performance	(a) Polyvinyl chloride (b) carbonyl
fibre other found with trade names rayon, nylon, and Dacron (trademark).	(c) Teflon (d) Nylon
	RRB Group-D 26-10-2018 (Shift-II)
4. Synthetic fibers catches fires easily, however the uniform of fireman have a coating of	Ans : (a) Polyvinyl chloride (PVC) is a thermogenic
	material. PVC Pipes, sheets, tiles, doors, cable insulation,
(a) Nylon (b) Melamine	etc. are made from Polyvinyl chloride, whereas nylon
(c) Rayon (d) Acrylic	was the first fiber blended by humans. It is used to make tooth brushes, parashoot clothes, rope for mountaineer
RRB NTPC 01.04.2021 (Shift-II) Stage Ist	and fishing nets. Teflon is a polymer of tetrafluoro
Ans. (b) : The uniforms of fireman have a coating of	ethylene. Now days, for protection of two wheel and four
melamine plastic to make them flame resistance.	wheel vehicles, Teflon is coated on them so that the paint
Melamine is a thermosetting plastic and is also used to	does not get atches.
make floor tiles all kinds of fire resistant febries and	
make floor tiles, all kinds of fire resistant fabrics and	
also kitchenware. Synthetic fibers are Rayon, Nylon,	10Is not a thermoplastic polymer.
also kitchenware. Synthetic fibers are Rayon, Nylon, Acrylic, Polyester etc.	10Is not a thermoplastic polymer.(a)Polyvinyl chloride (PVC)
<ul><li>also kitchenware. Synthetic fibers are Rayon, Nylon, Acrylic, Polyester etc.</li><li>5. Bakelite is a?</li></ul>	10Is not a thermoplastic polymer.(a) Polyvinyl chloride (PVC)(b) Teflon
also kitchenware. Synthetic fibers are Rayon, Nylon, Acrylic, Polyester etc.5.Bakelite is a? (a) Insulator(b) Semiconductor	<ul> <li>10Is not a thermoplastic polymer.</li> <li>(a) Polyvinyl chloride (PVC)</li> <li>(b) Teflon</li> <li>(c) Bakelite</li> </ul>
<ul><li>also kitchenware. Synthetic fibers are Rayon, Nylon, Acrylic, Polyester etc.</li><li>5. Bakelite is a?</li></ul>	<ul> <li>10Is not a thermoplastic polymer.</li> <li>(a) Polyvinyl chloride (PVC)</li> <li>(b) Teflon</li> <li>(c) Bakelite</li> <li>(d) Polystein</li> </ul>

<b>Ans. (c)</b> Thermoplastic is a plastic polymer that is become soft when temperature increases and hardens	<b>3.</b> What is the general formula of soap? (a) RCOOMg (b) RCOONa
when temperature decreases. Examples of this are,	(c) RCOOCa (d) RCOOCI
polystein, Teflon, PVC, nylon, acrylic etc. Bakelite is a	RRB Group-D 12-12-2018 (Shift-III)
thermosetting plastic that is a insulator of heat power	Ans. (b) When fats are heated with sodium hydroxide
that is used to make electric switches and pottery	or potassium hydroxide, sodium or potassium salts of
handles.	fatty acids are obtained, along with glycerin. These salts
11. PVC stands for -	are called soap and this reaction of soap making is
(a) Polyvinyl chlorate (b) Polyvinyl carbon	called saponification. The general formula of soap is
(c) Polyvinyl chloride (d) Polyvinyl carbonate	RCOONa.
RRB Group-D 04-10-2018 (Shift-II)	4. Which of the following is a sub product of
Ans: (c) The full form of PVC is Polyvinyl chloride.	soap?
PVC is obtained by polymerization of vinyl chloride. It	(a) isopropane (b) butane
is used in coating electrical wires, thin sheets, film and	(c) glycerin (d) ethylene glycol
raincoat seat covers.	RRB JE 23.05.2019 (Shift-I)
12is avoided by coating the conductor	Ans. (c) Glycerin is a sub product of soap produced
(a) dripping (b) overloading	under the saponification process.
<ul><li>(a) dripping</li><li>(b) overloading</li><li>(c) short circuit</li><li>(d) fusing</li></ul>	5. Antiseptic properties in soap are found due to
RRB Group-D 18-09-2018 (Shift-II)	one of the following mixtures.
	(a) Bithional
<b>Ans. (c)</b> Polyvinyl chloride is an amorphous, thermally hardened substance that does not affect chemical	(b) sodium lauryl sulphate
substances. It is the third most produced plastic after poly	<ul><li>(c) Resins</li><li>(d) Sodium dodecylbazine sulphonate bithional</li></ul>
ethylene and polypropylene. It is used in a wide range of	RRB NTPC 07.04.2016 (Shift-III) Stage I <sup>st</sup>
applications in electronics, automobiles and other fields.	Ans : (a) The antiseptic properties in soap are due to
PVC is electrically neutral, so it is used for coating the	the mixture of bithionol. Bithionol is used in soaps and
wire, protecting against short circuits.	cosmetics due to its antibacterial and antihelmetic
	properties.
17. Soap / Detergents	6. What is a detergent called?
	8
1 Soans having long series of contains	(a) Soapless soap (b) Carbolic soap

	11 YCT

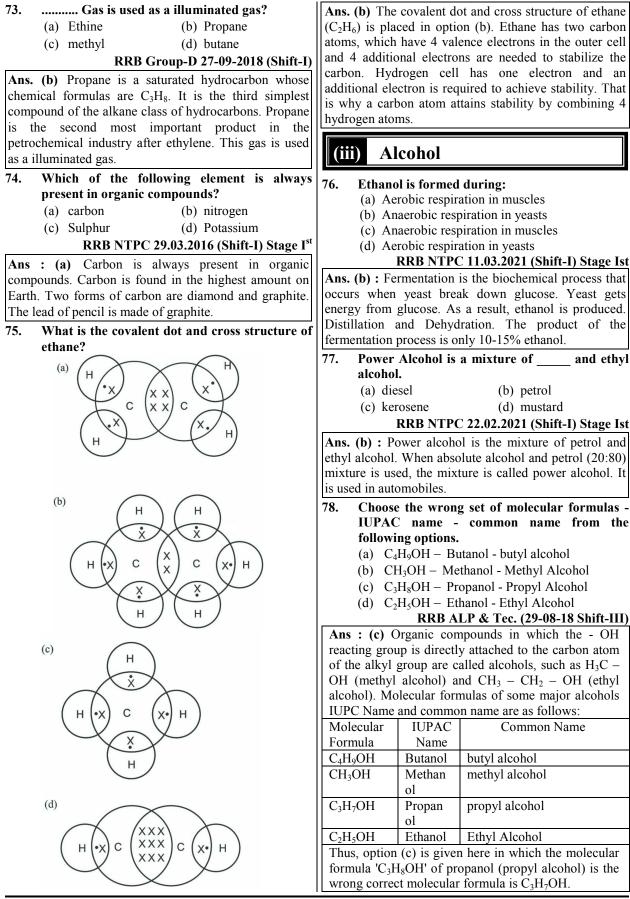

Ans. (b) The general chemical formula of alkene is	Ans. (d) Hydrocarbons that have only a single bond
$C_nH_{2n}$ Where n = 1, 2, 3, 4	between two carbon atoms are called saturated
IUPAC Name Chemical Formula	hydrocarbons. For example, alkanes, which have a
1. Ethene $C_2H_4$	common formula $C_nH_{2n+2}$ , and hydrocarbons that have
2. Propine $C_3H_6$	double bond between two carbon atoms, are called
3. Butene $C_4H_8$	alkenes, whose general formula is C <sub>2</sub> H <sub>2n</sub> and the tri-
4. Pentene $C_5H_{10}$	bond between carbon atoms is called unsaturated
27. Choose the wrong option for aldehyde.	hydrocarbon alkine. $C_nH_{2n-2}$ .
(a) $C_2H_5COH \rightarrow Propanol \rightarrow propaldehyde$	31. Which of the following has a triple bond?
(b) $CH_3COH \rightarrow Ethanol \rightarrow acetaldehyde$	(a) Propene (b) Propanol
(c) CHCOH $\rightarrow$ Methanol $\rightarrow$ Formaldehyde	(c) propanoic acid (d) propine
(d) $C_3H_7COH \rightarrow$ Butanol $\rightarrow$ butaldehyde	RRB Group-D 11-10-2018 (Shift-II)
RRB Group-D 27-11-2018 (Shift-I)	Ans. (d) Hydrocarbons are organic compounds that are
Ans. (c) According to IUPAC, the common chemical	obtained by simple combinations of hydrogen and
	carbon. Alkane, whose general formula is $C_nH_{2n+2}$ , is a
formula of aldehydes is $C_nH_{2n}O'$ . Where $n = 1, 2, 3, 4, \dots$	saturated hydrocarbon with a single bond between the
	carbon atoms, while alkyne and alkine cames under
n = 1 keeping, CH O HCHO Methanol formaldebude	unsaturated hydrocarbons with the common formula
$CH_2O - HCHO - Methanol - formaldehyde$	$C_nH_{2n}$ and $C_nH_{2n-2}$ , respectively. The double bond
n = 2 keeping C.H.O. – CH.CHO. – Ethanal – Acetaldebyde	between alkynes is present while the triple bond is
$C_2H_4O - CH_3CHO - E$ thanal - Acetaldehyde n = 3 n = keeping,	present in the alkines.
$C_3H_6O - C_2H_5CHO - Propanal - propaldehyde$	<b>32.</b> Which of the following represents alkane?
n = 4 n = keeping,	(a) $-C = C$ - (b) $-C = C$ -
$C_4H_8O - C_3H_7CHO - Butanal - Butaldehyde$	(c) $-C-C-$ (d) All of these
Hence option (c) is incorrect for aldehyde.	<b>RRB Group-D 10-10-2018 (Shift-II)</b>
	Ans : (c) Carbon-hydrogen atoms formed hydrocarbons
28. Alkanes are saturated hydrocarbons, in which	by bonding to a single bond are saturated hydrocarbons.
a single bond is found between two carbon atoms. The general formula is:	Saturated hydrocarbons are called paraffins or alkanes.
0	Its general formula is $C_nH_{2n+2}$ . like- $C_2H_6$ (Ethane)
(a) $C_nH_{2n+2}$ (b) $C_nH_{n+1}$ (c) $C_nH_{2n-1}$ (d) $C_nH_{2n+1}$	
$\begin{array}{c} (c) \ C_n \Pi_{2n-1} \\ \textbf{RRB Group-D 05-11-2018 (Shift-I)} \\ \end{array}$	Н-Ċ-Ċ-Н
Ans. (a) : Organic compounds in which carbon atoms are	
linked to each other only by a single bond are called	The hydrocarbons in which the two carbon atoms are
saturated hydrocarbons. Alkanes are saturated	joined together by a double bond or triple bond are
hydrocarbons. Some members of this category are $CH_4$	unsaturated hydrocarbons. They are more reactive than
(methane), $C_2H_6$ (ethane), $C_3H_8$ (propane), $C_4H_{10}$	saturated hydrocarbons.
(butane), Single bond is found in them. Their common	like- $H - C = C - H$ and $H - C \equiv C - H$
formula is $C_nH_{2n+2}$ .	<b>33.</b> What is the name of the compound CH <sub>3</sub> - CH <sub>3</sub> ?
29. One of the IUPAC names that is different given	(a) propane (b) butane
below. Select one of the names.	(c) ethane (d) methane
(a) $C_4H_8OH \rightarrow$ Butanol $\rightarrow$ butyl alcohol	RRB Group-D 10-10-2018 (Shift-II)
(b) $C_3H_7OH \rightarrow Propanol \rightarrow propyl alcohol$	Ans. (c) Hydrocarbon compounds whose carbon atoms
(c) $CH_3OH \rightarrow Methanol \rightarrow methyl alcohol$	are linked to each other by single covalant bonds are
(d) $C_2H_5OH \rightarrow$ Ethanol $\rightarrow$ Ethyl alcohol	called saturated hydrocarbon compounds.
RRB Group-D 12-11-2018 (Shift-I)	like-
Ans. (a) According to IUPAC, the common chemical	
formula of alcohols is $C_nH_{2n+1}OH$ . Accordingly, the	Methane– CH <sub>4</sub>
chemical formula of butanol (butyl alcohol) would be	Ethane– CH <sub>3</sub> –CH <sub>3</sub>
$C_4H_9OH.$	Propane– CH <sub>3</sub> –CH <sub>2</sub> –CH <sub>3</sub>
<b>30.</b> Alkene, unsaturated hydrocarbon, which has a	Butane-CH <sub>3</sub> -CH <sub>2</sub> -CH <sub>2</sub> -CH <sub>3</sub>
double bond between two carbon atoms, has a	34. The proven formula using the compound is
common formula, which is:	$CH_2O$ , its vapor density is 90. The molecular
(a) $C_n H_{2n+2}$ (b) $C_n H_{2n-1}$	formula of the compound is:
	(a) $C_6H_{12}O_6$ (b) $C_6H_{10}O_4$
(c) $C_n H_{2n+1}$ (d) $C_n H_{2n}$	(c) $C_6H_{10}O_6$ (d) $C_6H_{12}O_4$

131 Table granulated sugar is known as	1
131. Table granulated sugar is known as(a) sucrose(b) dextrose	<b>21.</b> Chemical Reactions
(c) glucose (d) Fructose	
RRB NTPC 19.04.2016 (Shift-III) Stage I <sup>st</sup>	1. Which of the following determines that a
Ans : (a) Table granulated sugar is commonly known as	chemical reaction has not taken place?
sucrose. Sucrose is a common carbohydrate found in	(a) Change in size (b) Evolution of a gas
many plants and plant parts. Sucrose is the common	(c) Change in colour (d) Change in state
name for sugars in general, sucrose is extracted from	RRB NTPC 01.03.2021 (Shift-I) Stage Ist
sugarcane and sugar beet.	Ans. (a) : We can tell if a chemical reaction has taken
<b>132.</b> $C_{12}H_{22}O_{11}$ also known as-	place when one or more of the following things
(a) sand (b) sugar	happen:-
(c) salt (d) clay	• A colour change inside the reaction flask.
RRB NTPC 02.04.2016 (Shift-II) Stage I <sup>st</sup>	◆ Change in state
<b>Ans</b> : (b) $C_{12}H_{22}O_{11}$ is known as sugar. Sugar is a	◆ Change in temperature
source of sucrose. It tastes sweet. Sucrose (sugar) is	<b>Note:</b> -Change in size observation helps us to determine
used as a sweetener in homes.	whether a physical change occurs.
	2. In which chemical reaction do bonds or ions exchange between two compounds to form
<b>133.</b> The chemical formula of $C_{12}H_{22}O_{11}$ is - (a) Glucose (b) Galactose	different compounds?
	(a) substitution reaction
(c) lactose (d) Fructose <b>PPP</b> Crown D 04 12 2018 (Shift III)	(b) Dual displacement reaction
RRB Group-D 04-12-2018 (Shift-III)	(c) Redox reaction
Ans. (c) Lactose is a disaccharides. Its chemical	(d) direct combination reaction
formula is $C_{12}H_{22}O_{11}$ . They are sweet in taste. While the	RRB NTPC 04.04.2016 (Shift-III) Stage I <sup>s</sup>
chemical formula of glucose is $C_6H_{12}O_6$ .	Ans : (b) In a double displacement reaction, two
134. The glucose molecules having a carbons ?	different atoms or groups of atoms are exchanged. That
(a) 6 (b) 7	is, the anion and cation of different compounds
(c) 5 (d) 4	exchange places, forming two completely different
RRB Group-D 01-12-2018 (Shift-II)	compounds.
Ans : (a) The glucose molecule is a simple	3. Which of the following chemical reactions is always endothermic in nature?
carbohydrate molecule with 6 carbons. Its chemical	(a) combustion reaction
formula is - $C_6H_{12}O_6$ . It is a monosaccharide, glucose is	(b) decomposition reaction
sweet in taste and soluble in water and is a major source	(c) displacement reaction
of energy for living cells.	(d) combination reaction
135. What are the 4 major elements of amino acids?	RRB NTPC Stage I <sup>st</sup> 29.04.2016 (Shift-II)
(a) Iron, sulphur, silicon and potassium	Ans : (b) Reactions in which heat is absorbed are called
(b) Helium, lithium, beryllium and boron	endothermic reactions. All decomposition reactions are
(c) Plutonium, Uranium, Prometheum and Neon	endothermic reactions.
(d) Carbon, hydrogen, oxygen and nitrogen	Examples- $CaCO_3(s) + Heat \rightarrow CaO(s) + CO_2(g)$
RRB NTPC 04.04.2016 (Shift-I) Stage I <sup>st</sup>	4. The chemical reaction in which heat is released is
Ans : (d) The 4 major elements of amino acids are	called reaction.
carbon, hydrogen, oxygen and nitrogen. Protein is made	(a) exothermic (b) combination
up of different combinations of 20 amino acids, which	(c) endothermic (d) decomposition
are an important class of organic macromolecules and are	RRB NTPC Stage I <sup>st</sup> 19.01.2017 (Shift-II)
present in all organic components. It is mainly made up	<b>Ans : (a)</b> The chemical reaction in which heat is released
of carbon, hydrogen, nitrogen, oxygen and sulphur	is called an exothermic reaction. endothermic in thermodynamics refers to a process or chemical reaction
elements, all proteins are polymers of amino acids.	that converts thermal energy into bonded energy.
136. Which of the following is not present in	Examples - melting of ice, evaporation of water and
animals, whereas plants have it?	photosynthesis etc.
(a) cellulose (b) proteins	5. The process of fission of water molecule with
(c) fat (d) starch	electric current is called
RRB NTPC Stage I <sup>st</sup> 29.04.2016 (Shift-III)	(a) radiation-decomposition
Ans. (d) : Starch or amylum is a polysaccharide	(b) electro-decomposition
carbohydrate. Which is formed due to the addition of a	(c) light-decomposition
large number of glucose monosaccharide units by	(d) heat-decomposition
glycosidic bonds. It is found only in plants.	RRB NTPC Stage I <sup>st</sup> 19.01.2017 (Shift-II)
	· · · · · · · · · · · · · · · · · · ·

with electrical energy is called electrical decomposition is the process by which and electric current is passed in a chemical compound to hydrogen and oxygen, which is called electrical decomposition of water. 6. A reaction in which one or more molecules of a substance are interconnected through a double or triple bond is called? (a) estrification (b) addition reactions (c) Functional group (d) Water decomposition or saponification <b>RRB Croup-D 05-11-2018 (Shiff-1H)</b> <b>Ans.</b> (b) An addition reaction in which one or more molecules of a substance are interconnected through a double of triple bond is called? (a) estrification (b) exothermic reaction is an example of		1
Electrical decomposition is the process by which is chemical bonds, for example to conduct the formation of calcium break, its chemical bonds, for example to conduct, this a highly exothermic reaction. Whereas, its chemical bonds, for example to conduct, this a highly exothermic reaction. Whereas, its a bisfance are interconnected through a double or triple bond is called? <ul> <li>(a) estification</li> <li>(b) addition reactions</li> <li>(c) Functional group</li> <li>(c) Functional group</li> <li>(d) water decomposition or suponification models of a substance are interconnected through a double or triple bond is called?</li> <li>(c) addition reaction in which one or more molecules of a substance are interconnected through a double or triple bond is called?</li> <li>(c) Dubit bond is called?</li> <li>(d) Water decomposition or suponification models bond is called?</li> <li>(e) Dubit of the following reactions is an example of an endothermic reaction?</li> <li>(f) Burghes Chy = CH<sub>2</sub> = CH<sub>2</sub> - CH<sub>2</sub></li></ul>	Ans : (b) The process of fission of a water molecule	Ans. (d) An Exothermic reaction is a chemical reaction
electric current is passed in a chemical compound break its chemical books, for example to conduct lectricity in water. Then water is decomposed in of water and Sublimation of camphor are indothermic reactions.of heat is released along with the formation of camphor are indothermic reactions.6. A reaction in which one or more molecular of a substance are interconnected through a double or triple bond is called.f) the reaction of sodium sulphate and barium (a) enterification (b) addition reactions in (c) Functional group.10 f) the reaction of sodium sulphate and barium (b) addition reaction in (c) double displacement reaction (d) water decomposition of sodium hydroxide in water. (a) dissolution of sodium hydroxide in water (a) dissolution of sodium hydroxide in water (a) dissolution of sodium hydroxide in water. (a) dissolution of sodium hydroxide in water? (a) decomposition of ferrous sulphate is a cample of an endothermic reaction. (b) The decomposition of ferrous sulphate is a mample of an endothermic reaction. (c) Dilution of sulphuric acid (d) burning of natural gas <b>RRB JF 2505.2019 (Shift-III)</b> ( <b>RTB B F 2505.2019 (Shift-III)</b> (a) decomposition of ferrous sulphate is and examples of an endothermic reaction. (c) neutral reaction (c) neutral reaction 	with electrical energy is called electrical decomposition.	that involves the release of energy in the form of heat or
electric current is passed in a chemical compound break its chemical books, for example to conduct lectricity in water. Then water is decomposed in of water and Sublimation of camphor are indothermic reactions.of heat is released along with the formation of camphor are indothermic reactions.6. Ans : (c) On burning carbon in oxygen, carbon dioxide	20. What happens when a metal reacts with
is produced. It is a combustion reaction.	oxygen?
Carbon + Oxygen - Carbon Dioxide (Gas)	(a) nonmetal oxide (b) metallic hydroxide
15. The equation $2Cu + O_2 - 2CuO$ is an example	(c) Metallic oxide (d) Nonmetal hydroxide
of	RRB Group-D 29-10-2018 (Shift-III)
(a) Dual displacement reaction	Ans. (c) When the metal reacts with oxygen, metallic
(b) Combination reaction	oxide is formed.
(c) decomposition reaction	$2Cu + O_2 \rightarrow 2CuO$
(d) displacement reaction	
RRB Group-D 20-09-2018 (Shift-III)	21 made the first observation on platinum
	as a catalyst -
Ans. (b) The reaction in which two or more reactants form	(a) Mendeleev (b) Mosely
a single product is called a combination reaction such as:	(c) Dobereiner (d) Newland
$2Cu + O_2 \rightarrow 2CuO$	RRB Group-D 12-10-2018 (Shift-III)
When copper (Cu) reacts with oxygen (O <sub>2</sub> ), copper	Ans. (c) The German scientist Johann Döberiner first
forms its oxide.	observed platinum as a catalyst in 1823 AD.
16. The chemical reaction between cement and	22. In hydrogenation of vegetable oil, as a catalyst.
water is called?	
(a) hydration (b) chlorination	$\dots$ Is used.
(c) Dissolution (d) None of these	(a) helium (b) nickel
RRB SSE (21.12.2014, Set-08, Green paper)	(c) lead (d) hydrogen
<b>Ans : (a)</b> When water is added to the cement, the pulp	RRB Group-D 26-09-2018 (Shift-I)
	Ans. (b) The action in which hydrogen combines with
of the cement is formed. After some time, this pulp	vegetables oils is called hydrogenation of oils.
begins to freeze and becomes strong and takes its	Hydrogen gas flow by heating the vegetable oil to $150^{\circ}$ -
strength. This action is called hydration of cement.	$180^{\circ}$ C in the presence of nickel metal, causes
During the hydration of the cement, 120 cal / gm of heat	hydrogenation of the oils, and the oil is converted into a
is released.	granular solid, called vegetable ghee.
17. The best reaction occurs when sodium sulphate	23. The reaction in which electricity is passed with
reacts with barium chloride.	<b>5</b> 1
(a) single displacement (b) dual combination	10% NaCl is called-
(c) double displacement (d) single combination	(a) chloro-alkali reaction
RRB Group-D 28-09-2018 (Shift-II)	(b) chlor-salt reaction
Ans. (c) When sodium sulphate reacts with barium	(c) Byers reaction
chloride, sodium chloride and barium sulphate are	(d) Hall-Heralt reaction
formed. This reaction is called double displacement.	RRB Group-D 22-09-2018 (Shift-I)
BaCl <sub>2</sub> (aq) + Na <sub>2</sub> SO <sub>4</sub> (aq) $\rightarrow$ 2 NaCl (aq) + BaSO <sub>4</sub> (s)	Ans. (a) Chloro-alkali reaction- When electricity is
	transferred from an aqueous solution of 10% NaCl,
18. The reaction in which electricity is passed with	NaCl is converted into chlorine gas and sodium
10% NaCl is called-	hydroxide. This reaction is called chlor-alkali reaction.
(a) chlor-Alkali reaction	24. What is exchanged between the reactants
(b) chlor-salt reaction	during a dual decomposition reaction?
(c) Byers reaction	(a) ion (b) electron
(d) Hall-Heralt reaction	
RRB Group-D 22-09-2018 (Shift-I)	
Ans : (a) Chlor-Alkali reaction–	<b>RRB Group-D 20-09-2018 (Shift-III)</b>
When electricity is passed through an aqueous solution	Ans. (a) During the double decomposition reaction, an
of 10% NaCl, NaCl dissociates to provide chlorine gas	ion is exchanged between the reactants because any
and sodium hydroxide and hydrogen gas. This reaction	atom is positively charged when the electron is
is called chlor-alkali reaction.	abandoned and negatively charged when the electron is
$2NaCl + 2H_2O \xrightarrow{Heat} 2NaOH + Cl_2 + H_2$	taken up. Hence, here electrons live as an ion.
2 2 2	$(\stackrel{+}{\operatorname{Ion}}) \leftarrow (\operatorname{Atom}) \longrightarrow (\overline{\operatorname{Ion}})$
19. What products are manufactured in the chlor-	lon (Atom) Ion
alkali process?	Electron Electron
(a) Chlorine and calcium hydroxide	Loss gain
(b) chlorine and potassium hydroxide	25. $2Mg + O_2 \rightarrow 2MgO$
(c) Chlorine and aluminium hydroxide	The above reaction An example of a
(d) chlorine and sodium hydroxide	reaction is -
RRB Group-D 02-11-2018 (Shift-II)	(a) combination
Ans. (d) In the chlor-alkali process, when an electric	
current is passed in an aqueous solution of 10% sodium	(b) decomposition
	(c) displacement
chloride (ordinary salt), it dissociates to provide sodium	(d) double displacement
hydroxide, chlorine gas, and hydrogen gas.	RRB Group-D 26-11-2018 (Shift-III)

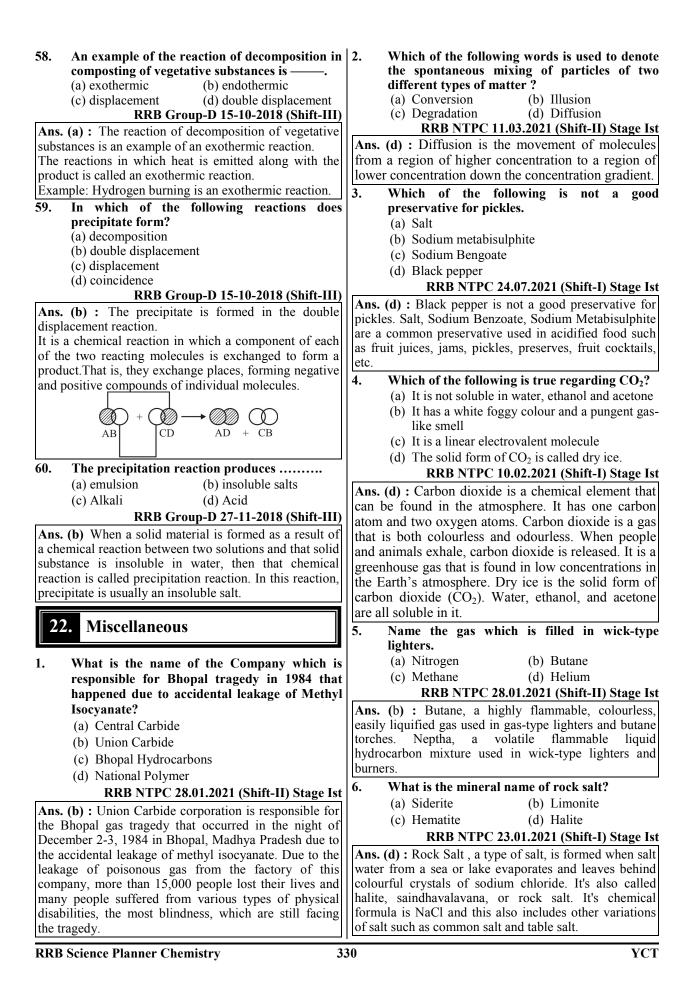

Ans: (a) The chemical reaction in which two or more	Ans : (d) (A) In the reaction in which all those changes
reactants combine to form a new product, such a	are reversed or reversed in the same way as they were
chemical reaction is called a combination reaction.	done on the upside, such a reaction is called reversible
like-	reaction. like-
(1) CaO + H <sub>2</sub> O $\rightarrow$ Ca (OH) <sub>2</sub>	$N_2(g) + 3H_2(g) \xleftarrow{Fe}{} 2NH_3(g)$ This is an example
$(2) 2Mg + O_2 \rightarrow 2MgO$	John
26. Notice the $P_4O_{10} + H_2O \rightarrow H_3PO_4$ equation.	of a reversible reaction.
Essential particles of water in this reaction	B. In a thermal decomposition, the molecule breaks
Will be	down into two or more molecules upon heating the
(a) 2 (b) 6	compound, but they do not become molecules of the
(c) 8 (d) 4	original compound again when cooled. Example of
RRB Group-D 01-12-2018 (Shift-II)	thermal decomposition reaction -
<b>Ans</b> : (b) $P_4O_{10} + 6H_2O \rightarrow 4H_3PO_4$	$CaCO_3 (s) \xrightarrow{sunlight} CaO(s) + CO_2(g)$
The required particles of water in this reaction will be 6.	<b>30.</b> Complete the given chemical reaction.
	1 8
27. The given reaction is an example of	$CH_3CH_2OH+3O_2 \rightarrow$
••••••	(a) $CO_2 + 3H_2O + Energy$
$BaCl_2 + Na_2SO_4 \rightarrow BaSO_4 + 2NaCl$	(b) $CO_2 + H_2O + Energy$
(a) displacement reaction	(c) $2CO_2 + 3H_2O_1 + Energy$
(b) decomposition reaction	(d) $CO_2+H_2O+$ Heat
(c) Photolytic decomposition	RRB Group-D 05-12-2018 (Shift-II)
(d) Dual displacement reaction	Ans. (c) When ethyl alcohol reacts with oxygen, it
RRB Group-D 16-11-2018 (Shift-III)	breaks down into carbon dioxide and water and releases
	energy -
Ans. (d) In a Dual displacement reaction two different	$CH_3CH_2OH+3O_2 \rightarrow 2CO_2 + 3H_2O + Energy$
atoms or groups of atoms are exchanged.	31. The catalysts are those substances which-
$Na_2SO_4 + BaCl_2 \rightarrow BaSO_4 + 2NaCl_4$	(a) release the reactants
(Sodium (barium (sodium)	(b) accelerate the reactions
Sulphate) chloride) sulphate) chloride)	(c) inactivates the reactions
The reaction of $Ba^{+2}$ and $SO_4^{-2}$ in the above chemical	(d) Reverses reactions
equation creates precipitates of BaSO <sub>4</sub> . Another product	
is also the manufacture of sodium chloride.	<b>RRB Group-D 25-09-2018 (Shift-II)</b>
28. This compound is sometimes added to the food	Ans : (b) A chemical substance whose presence
for quick cooking. It is a mild non-corrosive	increases or decreases the rate of a chemical reaction
alkali. The reaction given below shows the	but does not itself participate in the chemical reaction is
action of its formation. Name this compound.	called a 'catalyst' and this process is called 'catalysis'.
$NaCl + H_2O + CO_2 + NH_3 = ?$	32. Fe + CuSO <sub>4</sub> $\rightarrow$ FeSO <sub>4</sub> + Cu. The given reaction is
(a) Sodium carbonate	an example of the following:
	•
(b) Sodium hydrogen carbonate	(a) decomposition reaction (b) combustion reaction

34. Which of the following statements is / are true?	Ans. (d) Chemical reactions that can occur under
Statement:	similar conditions, in the forward direction (toward the
A. The example given below is of an	products) and the backward (towards the reactants), are
irreversible	called reversible reactions. like-
reaction:	$N_2(g) + 3H_2(g) \rightleftharpoons 2NH_3(g)$
$N_2(g) + 3H_2(g) \rightleftharpoons 2NH_3(g)$	$H_2 + I_2 \rightleftharpoons 2HI$
B. The example given below is of dual	$NH_3 + HCl \implies NH_4Cl$
displacement reaction:	Thus the reaction here, $N_2(g) + 3H_2(g)$ Is not
$2Mg(s) + O_2(g) \longrightarrow 2MgO(s)$	2 (- )
(a) Only A is true.	an irreversible reaction. In additive combination
(b) Only B is true.	reaction, two or more substances combine to form a
(c) Both A and B are false.	new substance. like-
(d) Both A and B are true.	$C + O_2 \longrightarrow CO_2$
RRB Group-D 05-11-2018 (Shift-II)	$2Mg(s) + O_2(g) \longrightarrow 2MgO(s)$
Ans: (c)The reaction given	Hence only statement B is correct.
$N_{2(g)} + 3H_{2(g)} \rightarrow 2NH_{3(g)}$	
This reaction is an example of a reversible reaction.	37. Pb + CuCl <sub>2</sub> $\rightarrow$ PbCl <sub>2</sub> + Cu. Given equation
And reaction $2Mg + 0 \rightarrow 2Mg0$	An example of a reaction.
$2Mg_{(s)} + O_{2(g)} \rightarrow 2MgO_{(s)}$ This is an example of a combination reaction / additive	(a) displacement (b) combination
reaction. Hence both statements A and B are false.	(c) double displacement (d) decomposition
35. Which of the following statements is / are true?	RRB Group-D 22-10-2018 (Shift-II)
A. The following reaction is an example of a	Ans : (a) $Pb + CuCl_2 \rightarrow PbCl_2 + Cu$ The equation is
reversible reaction:	an example of a displacement reaction. A displacement
$N_2(g) + 3H_2(g) \rightarrow 2NH_3(g)$	reaction is a chemical reaction in which a more reactive
B. The following reaction is an example of a	element displaces a less reactive element in their
thermal decomposition reaction:	solution. Both metals and non-metals take part in this
$CaCO_3(s) \xrightarrow{Heat} CaO(s) + CO_2(g)$	reaction.
(a) Both A and B are untrue	$Pb + CuCl_2 \rightarrow PbCl_2 + Cu$ An example of a single
(b) Only B is true	displacement reaction. Here Pb is more reactive than
(c) Both A and B are true	Cu. That is why the $CuCl_2$ solution displaces Cu.
(d) Only A is true	38. Dehydration of ethanol is achieved by heating

<ul> <li>25. Which of the following is stored in the body as glycogen? <ul> <li>(a) Carbohydrate</li> <li>(b) Protin</li> <li>(c) Lipid</li> <li>(d) Vitamine</li> </ul> </li> <li>RRB NTPC 05.04.2021 (Shift-II) Stage Ist</li> </ul> Ans. (a) : Glucose is the main source of energy for our cells. When the body does not need to use the glucose for energy, it stores it in liver and muscles. This stored form of glucose is made up of many connected glucose molecules and is called glycogen. Glycogen in a	<ul> <li>Ans. (a) : The IAEA is the world's centre for cooperation in the nuclear field. It was set up as the world's "Atoms for Peace" organization in 1957 within the United Nations family. The Agency works with its member states and multiple partners worldwide to promote the safe, secure and peaceful use of nuclear technologies.</li> <li>30. Which of the following is bio-degradable Substance?         <ul> <li>(a) Polythene</li> <li>(b) Aluminium Cans</li> <li>(c) Glass</li> <li>(d) Plants</li> </ul> </li> </ul>
polysaccharide, which is absored in human body. It	RRB NTPC 22.01.2021 (Shift-I) Stage Ist
<ul><li>serves as a reserve carbohydrate to animals.</li><li>26. What do the letter NPK on a fertilizer pack</li></ul>	Ans. (d) : The material or products which may be
<ul> <li>20. What do the letter NYK on a fertilizer pack indicates?</li> <li>(a) Nitrogen, Potassium, Phosphors</li> <li>(b) Nitrogen, Phosphorus, Potassium</li> <li>(c) Nitrogen, Phosphoric acid, Potassium</li> </ul>	degraded by the action of the micro-organisms are known as biodegradable products means these products are easily degraded naturally by the actions of micro- organisms. <b>Examples</b> –Green plants and other organic materials.
(d) Nitric acid, Phosphorus, Potassium	31. Which one of the following is NOT an element?
RRB NTPC 04.03.2021 (Shift-II) Stage Ist	(a) Germanium (b) Graphite
Ans. (b) : All fertilizer products provide some uniform	(c) Silicon (d) silica
information to help consumers compare products	RRB NTPC 03.02.2021 (Shift-II) Stage Ist
easily. Every label carries three conspicious numbers, usually right above or below the product name. These three letters form what is called the fertilizer's N-P-K ratio — the proportion of three plant nutrients in order: Nitrogen (N), Phosphorus (P) and Potassium (K). The product's N-P-K numbers reflect each nutrient's percentage by weight.	<ul> <li>Ans. (d) : Silica is not an element. It is a chemical compound. Silica also called silicon dioxide, compound of the two most abundant elements in Earth's crust, silicon and oxygen, SiO<sub>2</sub>. It is significant that, Silica gel is often used as a desiccant to remove moisture.</li> <li>32. Which of the following is the largest bauxite producing state of India?</li> </ul>
27. Which among the following is an amphoteric	(a) Bihar (b) Odisha
oxide?(a) Magnesium oxide(b) Sulphur dioxide(c) Phosphorus Pentoxide(d) Zinc oxide	(c) Punjab (d) Maharashtra RRB NTPC 13.01.2021 (Shift-II) Stage Ist RRB NTPC 04.01.2021 (Shift-I) Stage Ist
<b>RRB NTPC 11.03.2021 (Shift-I) Stage Ist</b> <b>Ans. (d) :</b> Amphoteric oxides are oxides, which behave as both basic and acidic oxides. Amphoteric Oxides contain the features of acidic and basic oxides as well that neutralize both acids and bases. Common examples of amphoteric oxides include SnO, ZnO, and PbO. Al <sub>2</sub> O <sub>3</sub> etc.	<b>Ans. (b) :</b> Odisha is the largest producer of bauxite in India, accounting for 51% of India's total production Bauxite is produced on a large scale in the Koraput Kalahandi and Sambalpur districts of Odisha. Among other states bauxite is also produced from Gujarat, Jharkhand, Maharashtra and Chhattishgarh. It is the main ore of Aluminium metal.

	sterling silver is 925. It is an alloy in which silver
Ans : (c) Trade name Chemical substance Chemical formula	weights 92.5% and 7.5% of other metals. For example,
A. Quick lime Calcium oxide CaO	99.9% pure silver is soft, so other metals (copper) are
B. Slaked lime Calcium hydroxide $Ca(OH)_2$	
C. Urea Carbamide $NH_2CONH_2$	added to increase hardness strength.
D. Sodium Soda Sodium Carbonate Na <sub>2</sub> CO <sub>3</sub>	73. In what form can the mucilage be mixed with
	water?
(Washing soda)	(a) toothpaste (b) insect repellent
68. Who is considered the "father of modern	(c) gum (d) chewing gum
chemistry"?	RRB NTPC Stage I <sup>st</sup> 28.04.2016 (Shift-I)
(a) Ernest Rutherford	<b>Ans : (c)</b> The mucilage, when mixed with water can be
(b) Otto Hawn	used as glue. Mucilage is a thick, gluten-like substance
(c) Mendeleev	produced by almost all plants and some microbes.
(d) Antoine Lavoisier	74. Which part of the gas flame is the hottest?
RRB NTPC 12.04.2016 (Shift-I) Stage I <sup>st</sup>	(a) luminous (b) non-luminous
Ans: (d) Antoine Lavoisier is considered the "father	
of modern chemistry". The father of botany is	(c) blue (d) dark <b>RRB NTPC Stage I<sup>st</sup> 26.04.2016 (Shift-III)</b>
Theorphastus. The Greek philosopher Aristotle is called	
the father of biology. Aristotle is also called the father	Ans : (c) The blue part of the gas flame is the highest
of zoology, the branch of biology.	heated part of flama due to the presence of the more
	oxygen.
69. The oil zapper technique has been developed	75. To prevent potato chips from becoming rancid
by which to remove oil spread in the sea?	due to oxidation on frying potato chips, the gas
(a) IIT (b) TERI	filled in envelope is which gas?
(c) CSE (d) ISRO	(a) oxygen (b) hydrogen
RRB NTPC Stage I <sup>st</sup> 29.04.2016 (Shift-II)	(c) nitrogen (d) chlorine
Ans: (b) The Institute of Energy and Resources,	RRB NTPC Stage I <sup>st</sup> 22.04.2016 (Shift-II)
commonly known as TERI, developed the Zapper	Ans : (c) Nitrogen gas is filled in the envelope of the
technology to remove oil spilled into the ocean.	chips, to prevent potato chips from getting rancid due to
70. The full form of HCFCs is:	
(a) High density chlorofluorocarbon	oxygen.
	76. The spontaneous set of solvent molecules
(b) Hydro chlorofluoron carbon	through a semi permeable membrane in a
(c) Hydrated chlorofluorocarbon	region of high potential which is the
(d) Heated chlorofluoro carbon	direction in which solubility of soluble material
<b>RRB NTPC Stage I<sup>st</sup> 30.04.2016 (Shift-III)</b>	is normalized on both sides

	1
(a) active movement (b) inactive movement	81. One word out of four words in a group to
(c) reverse osmosis (d) osmosis	which the other three members belong.
RRB NTPC 07.04.2016 (Shift-III) Stage I <sup>st</sup>	Identify the group.
Ans : (d) Osmosis - The action that results in solvent	(a) sapphire (b) ruby
molecules passing through a semi-permeable membrane	(c) emerald (d) gemstone
from a low concentration solution to a higher	RRB NTPC 18.04.2016 (Shift-II) Stage I <sup>st</sup>
concentration is called the osmosis action. It is a	Ans : (d) Sapphire, ruby and emerald are the names of
physical activity in which molecules of a solution move	the gems. While the gemstone does not reveal any
through a semipermeable membrane without using any	specific gemstone.
bound energy. Energy is released in osmosis.	82used as a stabilizer in ice cream.
77. When the nozzle of a fire extinguisher is	(a) Gelatin (b) Sugar
pressurized, the acid combines with to	(c) Milk (d) Strawberry
produce carbon dioxide gas.	RRB NTPC 19.04.2016 (Shift-II) Stage I <sup>st</sup>
(a) Hydrochloric acid, sodium carbonate	Ans: (a) Gelatin is used as a stabilizer in ice cream.
(b) hydrochloric acid, sodium hydrogen carbonate	Gelatin is a colourless, tasteless, brittle, solid substance
(c) Sulphuric acid, sodium hydrogen carbonate	
(d) Carbonic acid, sodium carbonate RRB NTPC 07.04.2016 (Shift-I) Stage I <sup>st</sup>	that is formed from collagen in products derived from animal fauna.
<b>Ans : (c)</b> The reaction between sulphuric acid and sodium carbonate or sodium hydrogen carbonate is used to make	83. What do the following have in common?
fire extinguishers. A sealed glass bottle filled with dilute	Carbon, Silicon, Boron, Arsenic
sulphuric acid is placed inside a vessel filled with an	(a) They are all gases. (b) They are all non-metals.
aqueous solution of sodium carbonate. The resulting	(c) They are all metals. (d) There is no equality.
sulphuric acid is in contact with sodium carbonate, which	RRB NTPC 31.03.2016 (Shift-II) Stage I <sup>st</sup>
is inside the vessel and the produced $CO_2$ gas (carbon	Ans : (b) Carbon, silicon, boron, arsenic are all non-
dioxide) comes out and extinguishes the fire.	metals, which do not behave like element metals, are
78. Which of the following is not correct with	called non-metals. Non-metals are generally brittle, and
reference to bio sand water filter.	are conductors of electricity and heat.
(a) This disease neutralizes or kills people	84. Why can't fish survive in distilled water?
(b) Removes large particles of sedimentation	(a) Can not breathe in it
(c) Filtration removes small particles	(b) The osmosis dilutes the body fluids of the fish
(d) High quality water is always ensured	(c) It does not contain oxygen
RRB NTPC 11.04.2016 (Shift-II) Stage I <sup>st</sup>	(d) It does not contain food
Ans : (d) Providing high quality water is not the	RRB NTPC Stage I <sup>st</sup> 28.04.2016 (Shift-I)
function of the filter but to eliminate the dirt available	Ans : (b) Fish cannot survive in distilled water because
in the water. For high quality water, that water should	osmosis dilutes the body fluids of the fish. Distilled
have the properties that are used for drinking.	water is those water whose many impurities are purified
79. Mainly UHT processing is used to process the	by distillation, it is not suitable for drinking because it is
following.	not contains the mineral and salts which is necessary for
(a) oil (b) milk	life. It is used in surgical instruments and medical
(c) Petrol (d) Water	works.
<b>RRB NTPC 16.04.2016 (Shift-I) Stage I<sup>st</sup></b>	85. Which of the following statements is true?
<b>Ans : (b)</b> Ultra high temperature processing ((UHT))	(a) Water is a mixture of hydrogen and oxygen.
is a food processing technology that allows liquid food	(b) Water is a compound of nitrogen and oxygen.
to be preserved for a longer time by primarily treating milk by heating for 3 seconds at temperatures above	(c) Water is a compound of oxygen and hydrogen.
135 ° C.	(d) Water is an element.
	RRB NTPC 31.03.2016 (Shift-I) Stage I <sup>st</sup>
80. How many terminals are there in an cell electric electric?	Ans : (c) Water is a compound of oxygen and
(a) three (b) four	hydrogen. Its molecular formula is H <sub>2</sub> O, in which the
(c) one (d) two	atomic mass ratio of hydrogen and oxygen is 1: 8. Pure
RRB NTPC 18.04.2016 (Shift-III) Stage I <sup>st</sup>	water is neutral. Its pH value is 7.
Ans: (d) An electric cell has two terminals. All those	86. What is the process of mixing acid or alkali
devices are called electrical chemical cells which	with water resulting in a decrease in the
generate electric energy through chemical reaction or in	concentration or concentration of ions by
which electric energy starts or accelerates chemical	$H_2O^+/OH^-$ per unit volume?
reaction within them. The solar cell receives energy	(a) saponification (b) solvent
from the sun or some other source of light through the	(c) solution (d) solute
photovoltaic effect.	RRB Group-D 12-12-2018 (Shift-I)

can be molded into wire?(a) conductivity(b) porosity(a) conductivity(b) porosity(c) tensile(d) malleabilityRRB Group-D 16-10-2018 (Shift-I)Ans. (c) The property of a metal, due to which it can be pulled and molded into a wire, that property of the metal is called tensile. Gold (Au) has the highest tensile properties.(a) Isaac Newton(b) Mandel Brown (c) Robert Brown(c) acid rain(d) corrosion <b>91. Who discovered Brownian motion?</b> (a) Isaac Newton (b) Mandel Brown (c) Robert Brown (c) Robert Brown (c) Expandices of colloidal solutions always move in different directions (zigzag and irregular), which is called Dreawing This meticer writer(a) corrosionAns. (c) : The particles of colloidal solutions always move in different directions (zigzag and irregular), which is called Dreawing This meticer writer(b) Angle Brown (c) Robert Brown (c) Robert Brown (c) acid rainAns. (c) : The particles of colloidal solutions always move in different directions (zigzag and irregular), which a meticer writer(c) acid rain(d) John Brown (c) is colled and Dreawing meticer(c) acid rain(c) acid rain(d) John Brown (c) : The particles of colloidal solutions always move in different directions (zigzag and irregular), which a meticer writer(c) acid rain(d) Ans (c) : The particles of colloidal solutions always move in different directions (zigzag and irregular), which a meticer writer(c) acid rain(d) Ans (c) : The particles of colloidal solutions always move in different directions (zigzag and irregular), which a meticer writer(c) acid rain(		02 Which of the following statements is follow?

			RRB SSE 21.12.2014	(a) Theodor Schwann
			wann jointly formulated the	(b) Robert Hooke
			heory failed to state that how	(c) Matthias Schleiden
			olf Virchow (1855) clarified	(d) Rudolf Virchow
			new cells are formed from cellula-e-cellula). He	RRB NTPC 30.12.2020 (Shift-II) Stage Ist
		g cells (Omnis e hypothesis of S	cellula-e-cellula). He chleiden and Schwann to give	Ans. (b) Cell was discovered by Robert Hooke in 1665.
			which is explained below:	Cell is the structural and functional unit of living things.
		J	- r	

(ii) Plant Cell	A plant cell is surrounded by a rigid cell wall and animal cell does not have any cell wall.
<ul> <li>31. Plant cell walls are composed of: <ul> <li>(a) Cytosol</li> <li>(b) Cytoplasm</li> <li>(c) Cellulose</li> <li>(d) Glucose</li> </ul> </li> <li>RRB NTPC 24.07.2021 (Shift-II) Stage Ist</li> </ul>	<ul> <li>Presence of a large vacuole is seen in plant cells.</li> <li>Whereas, there are very small vacuoles as compared to plant cells are seen in animal cells.</li> <li>Centrosomes are absent in plant cells but present in animal cells.</li> </ul>
<b>Ans. (c)</b> Plant cell wall is composed of cellulose. Cellulose is a structural carbohydrate and is considered a complex sugar because it is used in both protection and structure.	<ul> <li>Plant cells have plastids but animal cells do not have plastids.</li> <li>Lysosomes are very rare in plant cells but animal cells have lysosomes.</li> </ul>
<ul> <li>32. Chlorophyll contains which of the following elements?</li> <li>(a) Aluminium (b) Calcium</li> <li>(c) Magnesium (d) Iron</li> <li>PDP NTPC 28 01 2021 (Shift II) Stage Ist</li> </ul>	<ul> <li>36. Which of the following pigments are responsible to determine the colours of fruits and vegetables?</li> <li>(a) Hemocyanin</li> <li>(b) Merocyanine</li> </ul>
<b>RRB NTPC 28.01.2021 (Shift-II) Stage Ist</b> <b>Ans.(c)</b> Chlorophyll molecule consists of a central magnesium atom surrounded by a nitrogen-containing structure called a porphyrin ring, attached to the ring is a long carbon- hydrogen side chain, known as a phytol chain. Chlorophyll, any member of the most important class of pigments involved in photosynthesis, the process by which light energy is converted to chemical energy through the synthesis of organic compounds.	<ul> <li>(c) Indocyanine (d) Anthocyanin</li> <li>RRB NTPC 27.02.2021 (Shift-I) Stage Ist</li> <li>Ans. (d) Anthocyanins are the pigments that are responsible for the colors, red, purple, and blue in fruits and vegetables. Berries, currants, grapes and some tropical fruits have high anthocyanins content. Hemocyanin and hemoglobin are respiratory proteins found in animal's blood.</li> </ul>
<ul> <li>33. Which of the following is called Yellow Pigmen in Plant? <ul> <li>(a) Carotene</li> <li>(b) Achromatic reaper</li> <li>(c) Xanthophyll</li> <li>(d) Creatinine</li> </ul> </li> <li>RPF Constable 16.02.2019 (Shift - III)</li> <li>Ans. (c) : Xanthophylls are yellow pigment in plant,</li> </ul>	<ul> <li>Blue, violet or red flavonoid pigment found in plants is due to the presence of:         <ul> <li>(a) Carotene</li> <li>(b) Anthocyanin</li> <li>(c) Xanthophiles</li> <li>(d) Chlorophyll</li> <li>RRB NTPC Stage I<sup>st</sup> 29.04.2016 (Shift-II)</li> </ul> </li> <li>Ans. (b) Blue, purple/violet or red flavonoid pigment</li> </ul>
that form one of two major divisions of carotenoid group. 34. Which cell organelle utilizes light energy	Ans. (b) Blue, purpreviolet of red havonoid pigment found in plants is due to the presence of anthocyanin. Anthocyanin is found in berries, onion, pomegranate, grapes, tomato, chocoberry etc.
during photosynthesis?(a) Golgi body(b) Mitochondria(c) Ribosome(d) ChloroplastRRB NTPC 07.04.2021 (Shift-I) Stage Ist	<ul> <li>38. Which of the following cell organelles is found in plant cell but not in animal cell?</li> <li>(a) Chloroplast</li> <li>(b) Endoplasmic reticulum</li> </ul>
<b>Ans: (d)</b> Chloroplast converts light energy into chemical energy. During photosynthesis, green colour of leaves is due to chlorophyll that helps in food preparation. That is why chloroplast is called the 'kitchen of the cell'.	<ul> <li>(c) Mitocondria</li> <li>(d) Ribosome</li> <li>RRB NTPC Stage I<sup>st</sup> 28.04.2016 (Shift-II)</li> <li>Ans. (a) Chloroplast is cell organelle found in plant cell</li> </ul>
<ul> <li>35. Which of the following statements is FALSE?</li> <li>(a) Plant cells have smaller vacuoles than those of animal cells</li> <li>(b) Plant cells are generally larger than animal</li> </ul>	but not in animal cell. Chlorophyll is the green photosynthetic pigment found in plants, algae, and cyanobacteria. 'Chlorophyll a' is a specific form of chlorophyll used in oxygenic photosynthesis.
<ul> <li>cells</li> <li>(c) Animal cells do not have plastids</li> <li>(d) Plant cells have cell wall, whereas animal cells do not</li> <li>RRB NTPC 09.03.2021 (Shift-II) Stage Ist</li> </ul>	<ul> <li>39. Which of the following components gives green colour to leaves?</li> <li>(a) Water</li> <li>(b) Nitrogen</li> <li>(c) Chlorophyll</li> <li>(d) Urea</li> <li>RRB JE 24.05.2019 (Shift-III)</li> </ul>
<ul> <li>Ans: (a) Differences between plant cells and animal cells-</li> <li>In size- Plant cell is larger than animal cell.</li> <li>In shape- Plant cells are square or rectangular in shape whereas animal cells are irregular or round shape.</li> </ul>	<b>Ans. (c)</b> Chlorophyll is the green photosynthetic pigment found in plant cells, algae, and cyanobacteria but it is absent in the animal cells. Chlorophyll is used in oxygenic photosynthesis. It absorbs most energy from wavelengths of violet-blue and orange-red light but it reflects green light. So, the leaves appear green.

40.	Name the pigment that gives plants their greencolour.(a) Carotenoid(b) Chlorophyll(c) Thiamin(d) ActinRRB NTPC 10.02.2021 (Shift-II) Stage Ist	<b>Ans. (c)</b> Blood is considered as connective tissue because it has a matrix. The living cell types are red blood cells, also called erythrocytes, and white blood cells, also called leukocytes. The fluid portion of whole blood, its matrix, is commonly called plasma. In blood
Ans	(b) See the explanation of above question.	the proportion of blood plasma and blood is 55:45.
41.	Complex carbohydrates that make up cell wall	There are three types of blood cells corpuscles RBC, WBC and platelets. RBC is responsible for

<ul> <li>9. What is blood? <ul> <li>(a) A muscle tissue</li> <li>(b) A packing tissue</li> <li>(c) A connective tissue</li> <li>(d) A supporting tissue</li> <li>RRB JE 02.06.2019 (Shift-III)</li> </ul> </li> <li>Ans. (c) See the explanation of the above question. <ul> <li>10. The lining of the mouth is made up of</li> <li></li></ul></li></ul>	<ul> <li>14. Which of the following is a connective tissue? <ul> <li>(a) Vascular bundle</li> <li>(b) Skin</li> <li>(c) Bone</li> <li>(d) Epithelium</li> </ul> </li> <li>RRB Group-D 22-10-2018 (Shift-II)</li> </ul> Ans. (c) Bone is a connective tissue. Connective tissue is fibrous tissue. The main component of the connective tissue of human is protein named as collagen. Connective tissue serves to connect one organ to another in the human body. It is found in every organ of human body. 15. Which tissues are found in bones of our body? <ul> <li>(a) Parenchyma</li> <li>(b) Permanent tissue</li> </ul>
<ul> <li>Ans. (c) Epithelium tissue forms the outer thin layer of organs and the inner layer of internal organs. It is composed of four types cuboidal epithelium, pseudo-stratified columnar epithelium, squamous epithelium and columnar epithelium, in which squamous epithelium is found on the outer layer of skin.</li> <li>11. There are many organs in our body.</li> </ul>	<ul> <li>(c) Connective (d) Epidermis <b>RRB Group-D 03-10-2018 (Shift-II)</b> </li> <li>Ans. (c) See the explanation of above question.     </li> <li><b>16.</b> Which of the following is not an animal tissue?         <ul> <li>(a) Muscle tissue</li> <li>(b) Connective tissue</li> <li>(c) Epithelial tissue</li> <li>(d) Nervous tissue</li> </ul> </li> <li><b>RRB Group-D 06-12-2018 (Shift-II)</b></li> </ul>
Which of the following organs is the largest?         (a) Stomach       (b) Kidney         (c) Skin       (d) Brain <b>RRB Group-D 08-10-2018 (Shift-III)</b> Ans. (c) The largest organ of the human body is the skin. It is the outer covering of the body called the epidermis. The skin is made up of several layers of epithelial tissue. The largest gland of the human body is the liver.	<ul> <li>Ans. (*) Muscle tissue, connective tissue, nerve tissue and epithelial- all four tissues are the animal tissues. Nerves are the fibres in the body of an organism through which signals are exchanged from one place to another. The nerves in the human body connect almost every part of the body to the brain or spinal cord and maintain a mutual contact with them.</li> <li>17 tissue forms the inner lining of our</li> </ul>
12.	mouth.         (a) Ciliated columnar epithelium         (b) Simple squamous epithelium         (c) Stratified squamous epithelium         (d) Columnar epithelium         RRB Group-D 26-09-2018 (Shift-III)
<ul> <li>flexible connective tissue (2) condensed connective tissue (3) specialized connective tissue. In loose connective tissue, the cells and fibers are loosely connected to each other by extracellular matrix, for example adipose tissue is loose connective tissue, which is predominantly found under the skin. The cells of this tissue are specialized for adipose tissue. The substances that are not in use, are converted into fat and stored in this tissue.</li> <li>13. Identify an example of a connective tissue in humans -         <ul> <li>(a) Muscles</li> <li>(b) Cells</li> <li>(c) Bones</li> <li>(d) Fibres</li> </ul> </li> </ul>	<ul> <li>Ans. (b) In cells, there is flat epithelium tissue cells on the blood vessel lining or follicle, where substances are transported by ductile permeable membranes, these are called simple squamous epithelium. It is very thin and flat and forms a soft layer. The alimentary canal and the lining of the mouth are covered with squamous epithelium. The body's protective shield, that is, the skin, is made up of these squamous epithelium. The epithelium cells of the skin are arranged in many layers to prevent them from cutting and bursting. Since they are arranged in a pattern of many layers, these epitheliums are called stratified squamous epithelium.</li> <li>18. Stratified squamous epithelium is present in:     <ul> <li>(a) Kidney</li> <li>(b) Respiratory system</li> </ul> </li> </ul>
<ul> <li>Ans. (c) Connective tissue connects one organ to another in the human body. The specific function of connective tissues is to connect, cover the organs and keep them at appropriate location. The connective tissues provide a structure to the body.Types of connective tissues are:</li> <li>flexible connective tissue</li> <li>specialized connective tissue</li> <li>dense connective tissue</li> </ul>	<ul> <li>(c) Esophagus (d) Skin <b>RRB NTPC 18.01.2017 (Shift-III) Stage II<sup>nd</sup></b> </li> <li>Ans. (d) Stratified squamous epithelium are found in nearly every organ system where the body comes into close contact with the outside environment – from the skin to the respiratory, digestive, excretory and reproductive systems. They also protect the body from desiccation and water loss.</li> </ul>

Stratified squamous epithelia consists of tissues formed	23. Which of the following is the outermost part of
